

IF YOU WANT TO BE 100%
SUCCESSFUL WITH YOUR
TRADING THEN SIMPLY
TRADE OFF THE 2ND DOT

BUY Trade taken on first Blue Candle at the cross of Trend line.

This is my 2nd trade today; I did +60 Pip\$ earlier and I know it says 217 but I closed out at +232 Pip\$ for a total of +292 Pip\$ so far today. The best trades are at the cross of the Trend line if you are in a SELL on a Pink Candle then instead of a stop loss just bail if a Blue Candle appears. If you're in a BUY on a Blue Candle again bail if a Pink Candle appears. For the opposite colour candle to appear price has got to cross back over the Trend line which means that you should no longer be in that trade and you should without hesitation cut your losses instantly and WAIT sit back and reassess the situation (check higher TFs, previous highs and lows, how far has Mmath run, 2/8ths, 3/8ths, 5/8th, are we at overbought +1/8th +2/8ths or oversold -1/8th -2/8ths). A 2nd red dot is great to a 1st Blue dot and a 2nd Blue dot is good to another blue dot or Arrow. Until price has crossed the Trend line then consider the current trend to be still in play. Again, this is why we WAIT for the cross. Keep it simple.

Xard777

I've been killing it all day, and the US market has still to open. Five winning trades so far today - the enclosed trade is the worst out of the five. Lately, I have switched from DOW to S&P but really, they are both on par with each other. You can see from the chart that I am working on a new dashboard, will do more on it this weekend.

As you can see I am working away on the 2nd Dot (testing 30min TF on US500) In between trades I am building up the new Dashboard (left of screen - just doing layout for now).

Here we have price moving off the 4hr Gold dashed line at the bottom... Also, notice the 1hr Aqua top line and the previous 4hr Gold top line. Followed up with a second trade... Another trade (Down this time) while waiting for US market to open... Trade no.4 (Up off 4hr Gold Dashed line). Slow Day :-)

[illegible]

Update Trade 1 closed at +18% and Trade 2 closed at +20%, Total 38% on Account today. I have also highlighted the Primary 2nd Dots (where we expect price to hold) as well as show the secondary 2nd Dots.

Working away on the Xmas edition...You can see where it generates the 2nd Dot and additional entries. I could never get the Pip\$ indy to show correctly on multiple trades (due to my crappy coding) so I have made it easy with a simple % growth figure ($100 / \text{accountbalance} * \text{accountequity} - 100$) which works great regardless of how many trades taken.

trade1

Trade2

you can see the cycle moves by way of the thick ZZ line and the DOTS. Off these cycle moves you can see the **2nd dot**, price tends to not go beyond this 2nd dot(SL) and we can safely start to take trades from here.

If and when price does cross back over a 2nd dot then simply get out, WAIT and watch.

The pattern will repeat and you can get in on the move and all the subsequent moves thereafter.

Once we recognise this type of 2nd dot move we simply repeat on all the UP and DOWN cycles day in day out.

We can see that price retreated back towards the 2nd dot 3408.62. The dot held and a SELL trade taken with an imaginary tight stop just above the 2nd dot. Like I said, just watch for the 2nd dot and watch what happens. It is not that hard. I gotta go, I am missing out on Pips.

Xard777 OOps! I forgot to mention, take a look at the Gold 4hr Dashed Support/Resistance lines on the chart. Keep them in mind when taking trades - they change every day :-)

I am out the market just now. Price will either blow past the 3408 on the US open or it holds and starts to come down again. Sitting on the sidelines waiting...

I am out the market just now. Price will either blow past the 3408 on the US open or it holds and starts to come down again.

#4242

Ok, Here we have the US500 with a 2nd Dot on the 15min chart @ 3537.68, we also have a 2nd Dot on the 1hr chart @ 3540.16 So this would be a good staging area to SELL from.

#4275

Update...

From Trade 2 SELL price made a gray dot then crossed back over the signal line (time to exit)

Waited for next top dot which turned out to be a new Day high (market did the same thing yesterday). As price was going down past the previous high dot I entered my SELL trade 3 and closed with +20% Still have the US market to go later today.

One last golden nugget of info...

When in an UP Trend we look to take only BUY Trades off the Bottom Dots (starting with the 2nd Dot).

The UP moves will be bigger than the down moves in an UP Trend.

When in a DOWN Trend we look to take only SELL trades off the Top Dots (starting with the 2nd Dot).

The DOWN moves will be bigger than the up moves in a DOWN Trend.

Again... This is NOT Rocket Science folks... Just take a look at the 15m ZZ1 (thick line) swing moves (i.e. ARROW moves)

When we are trading off a DOWN ARROW the DOWN moves are way bigger than the up moves during that DOWN cycle.

When we are trading off an UP ARROW the UP moves are way bigger than the down moves during that UP cycle.

#4290

Trade 4 SELL completes the first leg of the DOWN move. Sell taken just as price crosses the BUY/Pivot line on the 15m chart. Notice that both Trade 3 & Trade 4 SELLS were part of the DOWN move today which happens to be the Bigger Move DOWN than the up moves in this DOWN

cycle... who knew. All the best

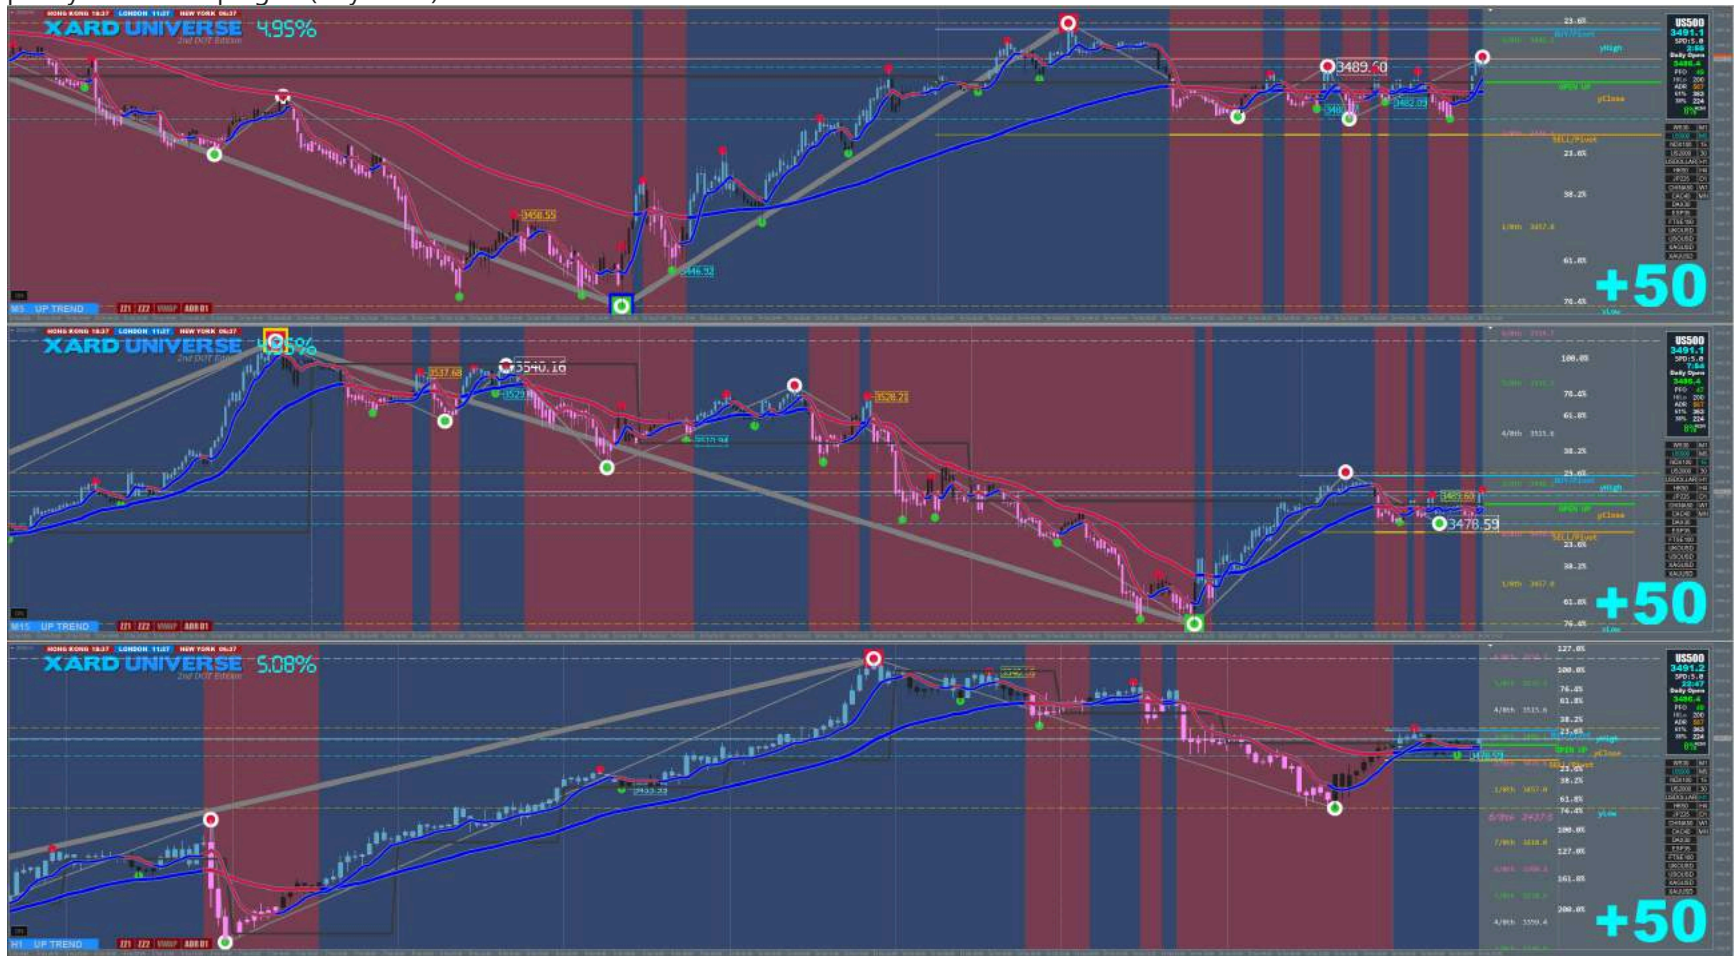

4305 Here is how it looks now. Did anyone happen to take the 2nd Dot UP move @ 3480.85? Price went UP for +200 Pip\$ I did not get it as I was pissing about with this semafor code :- (Should have waited until the weekend and just concentrated on the trades (but the idea was in my head and...)

Hi Everyone, I am trying to simplify the whole dot process so that we are all on the same page. Gold Square = Trend Top, we should see the market go DOWN from here. Red Square = Cycle Top, we want to take SELL trades off the Red Dots from the Red Square. White Circles = temporary market change i.e Pullback/Continuation of the cycle. Green Square = Cycle Bottom, we want to take BUY trades off the Green Dots from the the Green Square. Blue Square = Trend Bottom, we should see the market go UP from here. And it goes without saying that the 2nd Dot

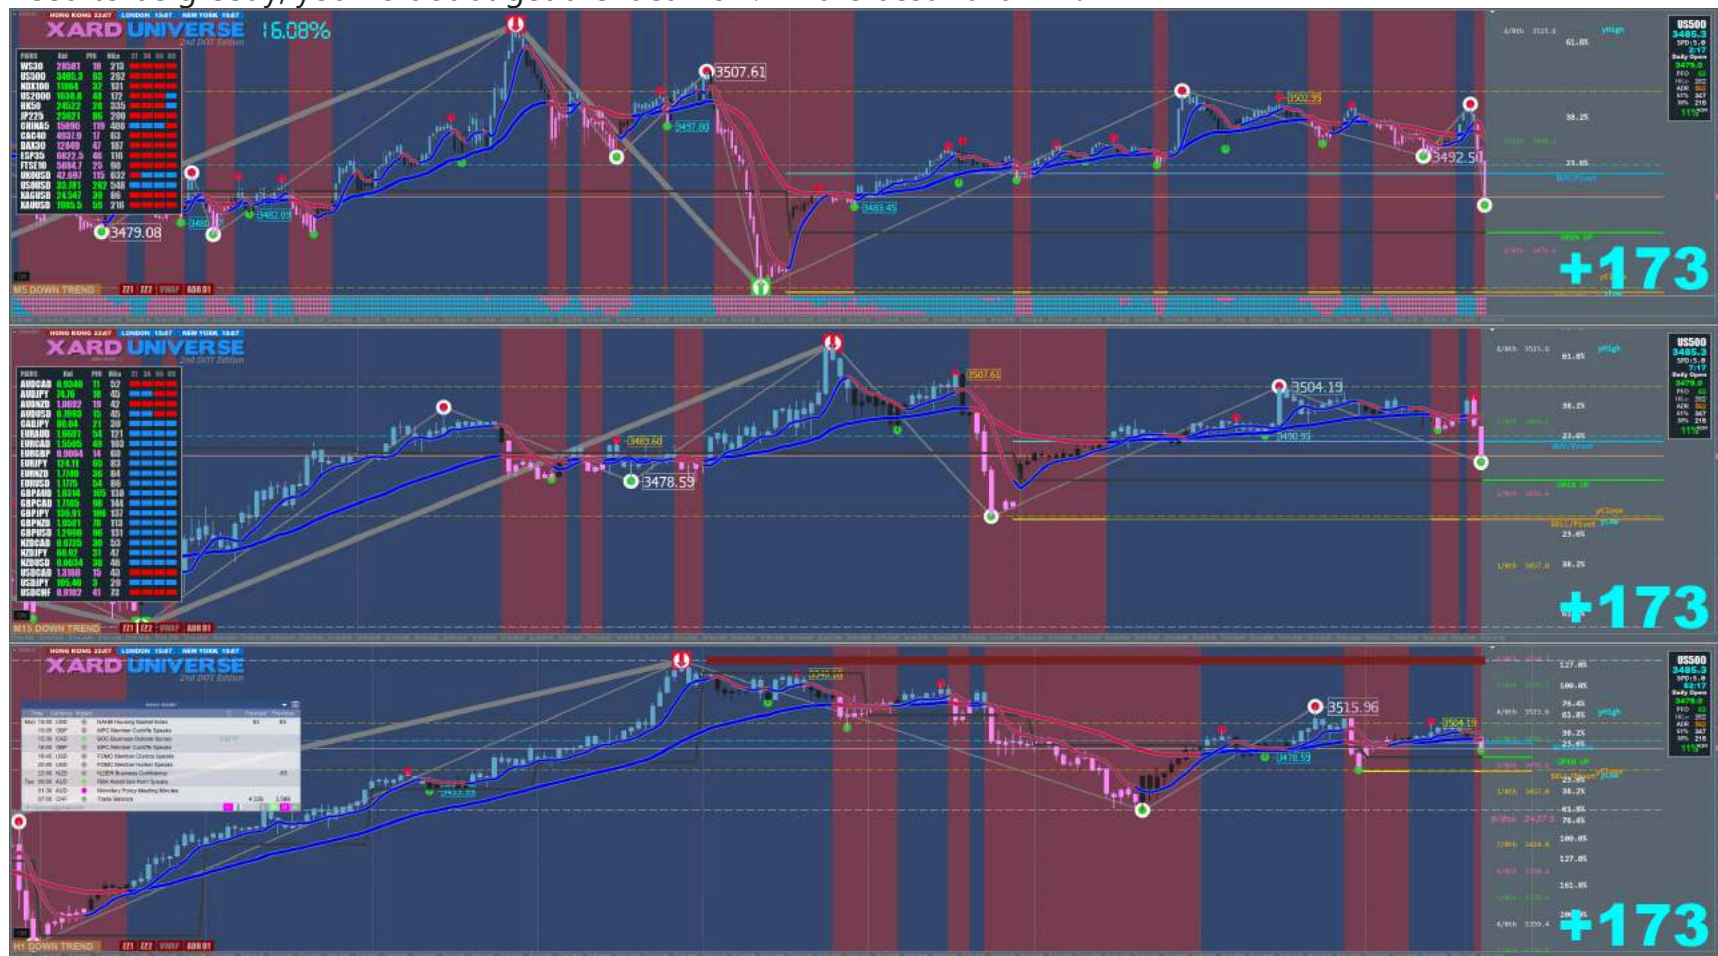

is where is all kicks off.

Update - The idea is that we would do our **MAIN Trading off the 1hr & 15m TFs** as the dots are in sync. We could of course then use the 5m purely for the scalping of (as you do).

#4418 That's me finished for the week. Everyone have a great weekend. It's Beers & Movies time... Let the lockdown begin WOOHOO!!!

I came out a bit early (closed my daughter's trade a bit later) Just one trade today, I did 16% and she did 21%, no need to be greedy, you no doubt get the idea now. All the best **Xard777**.

#4554

Booked 81 Pip\$ (delay in screenshot).. this was my second 5min scalper today. My previous Trade7 was a SELL (on the US500) just as price crossed down over the trend line (after the Red Down Arrow), was testing the Dash-Index so I have only taken a snapshot of it but you can see where the Indices were all Down making it real easy to pull the trigger at that particular time.

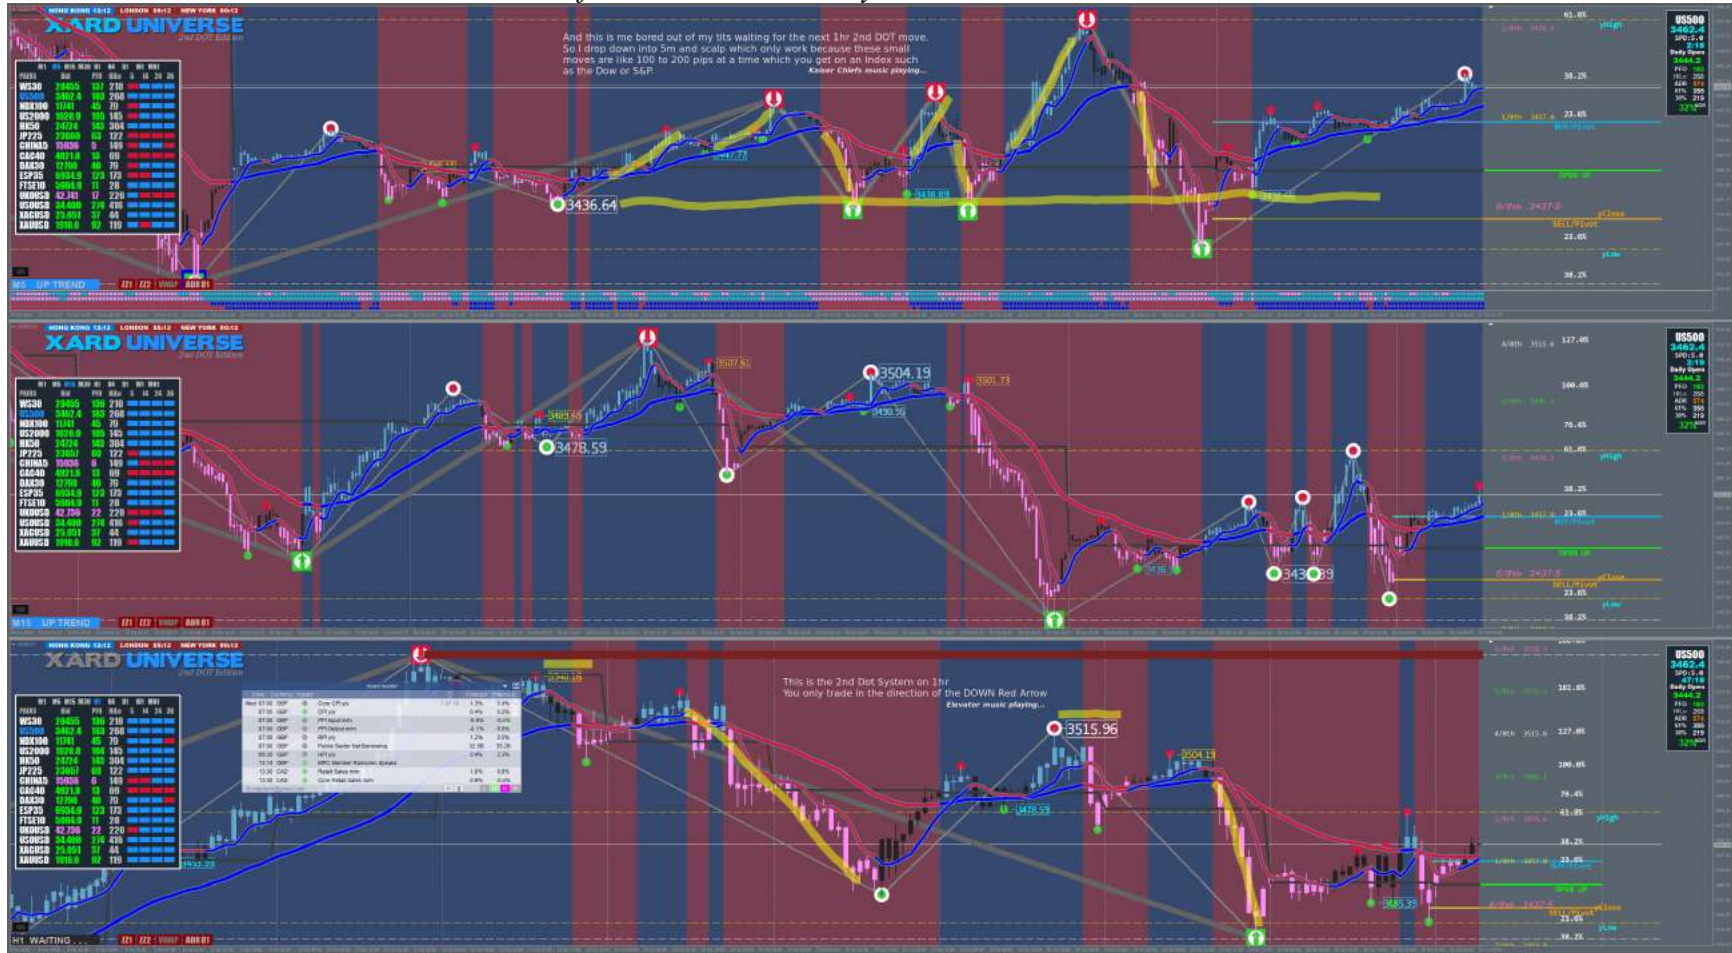

4567 This trade was another scalp on the 5m chart

The XARD UNIVERSE 2nd DOT System is designed to be traded on a 1hr and 4hr timeframe. And on the 1hr timeframe in Indices it is really good. But, while waiting for the next 1hr turn around we get bored.

Luckily, the tiny little movements in the 5m timeframe on the indices allow for in excess of +100 to +200 pips to be grabbed in order to alleviate our boredom.

This however, does not translate too well on forex and the like... My Bad.

Oh well, I totally messed that up.

I said to myself that the market was going down (based on 4hr not crossing above the Trend) and placed a SELL (as you do). As it was going down I thought I will test the screenshot so I hit the chicken switch thinking great, it's taken a snapshot. At which point I realised that I was out the market and I just watched like a rabbit caught in the headlights as the market plummeted another +160 Pips in about 15 seconds and all I could do was say Shiiiiit! You can see (if you zoom in) where I got out of the trade and the move continue way down another 160 pips.

Last Up move was just perfect (Xmas teaser chart enclosed). Have a great weekend everyone.

Jeez, I am just coming out with this, now you're telling me to discard it!

BEST VERSION : Re entry from a Pull-back/Continuation move using 5m 2nd Dot (as u do).

In the Xmas Edition I now show the 15m 2nd Dot & 2nd Arrow on the 5m chart.

Open SELL trade on US500 showing 1hr, 15m, & 5m charts

My trade went +274 then all the way down and I came out at +15.

I believe that the vacines threw a curve ball to my trade but at the end of the day I only have myself to blame.

I figured that it was going further down so decided to stay with the trade then gave up at +15

I then picked up another SELL and closed on the Green dot for +110

Will look to re-enter on red dot as the main Trend is still showing down.

Price has continued down and made a Large Blue dot on the 15m so I will WAIT and pick up my SELL on the next Blue dot.

1Hr main trend still down

Xard777

As a rule of thumb I like to quit while I am ahead, once I hit my target I tend to close my trades and walk away.
I know that there are tons more pips on the board but I like to take some meat of the bone and let everyone else fight over what's left.

The Dow & the S&P500 moves so much that you can easily pull your target trades out the market in mid move with little fuss and while the market is still moving. That is the main reason that I switched from Forex to Indices. No Carry trades necessary and a decent percentage markup to boot with less risk.

I know that I personally leave a shit load of Pip\$ on the table but as long as you hit your targets who cares.
You are in and out with less risk.

Look at the big picture, building your fund by compounding stable target moves along the way.
Take a moment to think about that before you rush into your next trade.

If you trade the Dow on 15m chart and trade the 2nd dot off the Square plus the subsequent 2nd Arrow off the Blue Dot or White Dot in the direction of the next Square then you will easily add 30 to 50% onto your fund every turnaround (Sq to Sq) which is like every week.
(Hell, even Hunter Xiden can't get that type of commission out of china), Trading the markets is the most lucrative business out there, no TAX to pay on your Profits, No dead shelf stock, no staff wages to pay, no sickness benefit to pay, no Staff PAYE, no Staff pension to top up, no Sick days to pay for, no staff pilfering, no returns to swallow, no rates to pay on massive warehousing and shopping mall outlets and no cargo vans to pay for and no hidden tax to pay. It's a WIN WIN WIN scenario.

Granted you can't just open an account and automatically start making consistent profits day in day out. You have to learn how the market moves, when to get in and when to get out and more importantly when to stay out.

But like any business and yes you should treat it like a business you have to go through your apprenticeship, it could be two years or seven years but once you come through the other side you will definitely reap the benefits. Garner as much knowledge as possible from forums and such and do not feel bad blowing up your account, in fact the best thing you can do is blow up your account twice. It's amazing how quickly we learn from our mistakes.

May 2021 be your best year ever and may you make a boat load of Pip\$.

All the best everyone

Happy New Year

Xard777
