

Purchase conditions:

Daily close of price above accumulation area

Maximum horizontal volume above the accumulation area is bullish (blue)

During a new day, if a rollback and test of the maximum volume zone occurs

A buy trade is opened subject to a risk-reward ratio of 1: 2 and higher

S / L for the lower bound

T / P high of the previous day

Conditions for sale:

Daily close below the accumulation area

Maximum horizontal volume below accumulation area bearish (red)

During a new day, a rollback and test of the maximum volume zone

A sell trade is opened, subject to a risk-reward ratio of 1: 2 and higher

S / L for upper bound

T / P low of the previous day

This variant of the strategy application improves the mathematical expectation of trades. But it should be borne in mind that there will be very few such transactions, since the price rarely tests the area of the previous day's maximum volume.
