

Information in the Document for those who do not fully understand the trading system

More detailed description

rules for buy trades

1. Daily closing price above the upper boundary.
2. Maximum volume above the upper boundary blue, bull.
3. Purchase from the level of maximum volume on the next day.
4. Stop loss is set behind the lower boundary.
5. Take profit, maximum of the previous day.
6. The important point is that the price has not yet updated the high of the previous day.

rules for sell trades

1. Daily closing price below the lower boundary.
2. Maximum volume below the lower boundary red, bear.
3. Selling from the level of maximum volume on the next day.
4. Stop loss is set behind the upper boundary.
5. Take profit, low of the previous day.
6. The important point is that the price has not yet updated the previous day's low.

Using the system in this variant is the best solution

- + high mathematical expectation.
- few trades.

The second variant of application is entry into the transaction without waiting for the price to test the level of maximum volume

- +more transactions, because the price rarely tests the level of maximum volume and starts the movement earlier.
- lower mathematical expectation.
