

The general idea with **The Forex Libra Code** system is that it does the math FOR YOU, to save you time!

You **insert your desired risk per trade and the system will make the calculations for you.**

So if you choose for example to risk 1% per trade, the system calculates this input and shows you the lot size you should trade in order to match your input.

You can choose your desired risk in % (Percentage) or in money (Dollars), and the system will tell you what lot size you should trade.

My goal by creating it was very simple - so that you DO NOT waste time on calculations - you can focus on trading!

The last setting is "**SL TO BE**"

I will explain how the system can move the Stop Loss (SL) to the Break Even (BE) level (the entry price) for you (and other aspects of the settings features) in greater detail in the DVDs. Simply put, once a specific level is reached while you are in a trade, the system can move the SL to the entry price and "free you from the risk."

This feature is VERY useful if you are unable, for whatever reason, to monitor your trade and to manage it.

Now that we have covered each component of the dashboard, let's look at the system's trading rules.
