

Hi friends,

I would like to share with you my strategy using 3 indicators:

- Nadaraya-Watson Estimator (Long term trend)
- Ehlers_I_trend_in_color (Short-term trend)
- Volatility Quality Indicator (Entries)
- Renko street Trend (sometimes to identify Short-term trend)

I usually use this information in the NY – Europe session, first I wait for the signal sent by the VQI indicator and see if matches with the nadaraya indicator (with the long-term trend), then I check if matches the short-term trend with the Ehlers_I_trend_in_color that has to be yellow and moving to the direction of the signal.

I am having really good results but would be helpful to have one indicator that combines these three criteria and send a signal in line with these.

Is there a good soul that could help with that coding or am I talking nonsense?

All the best
