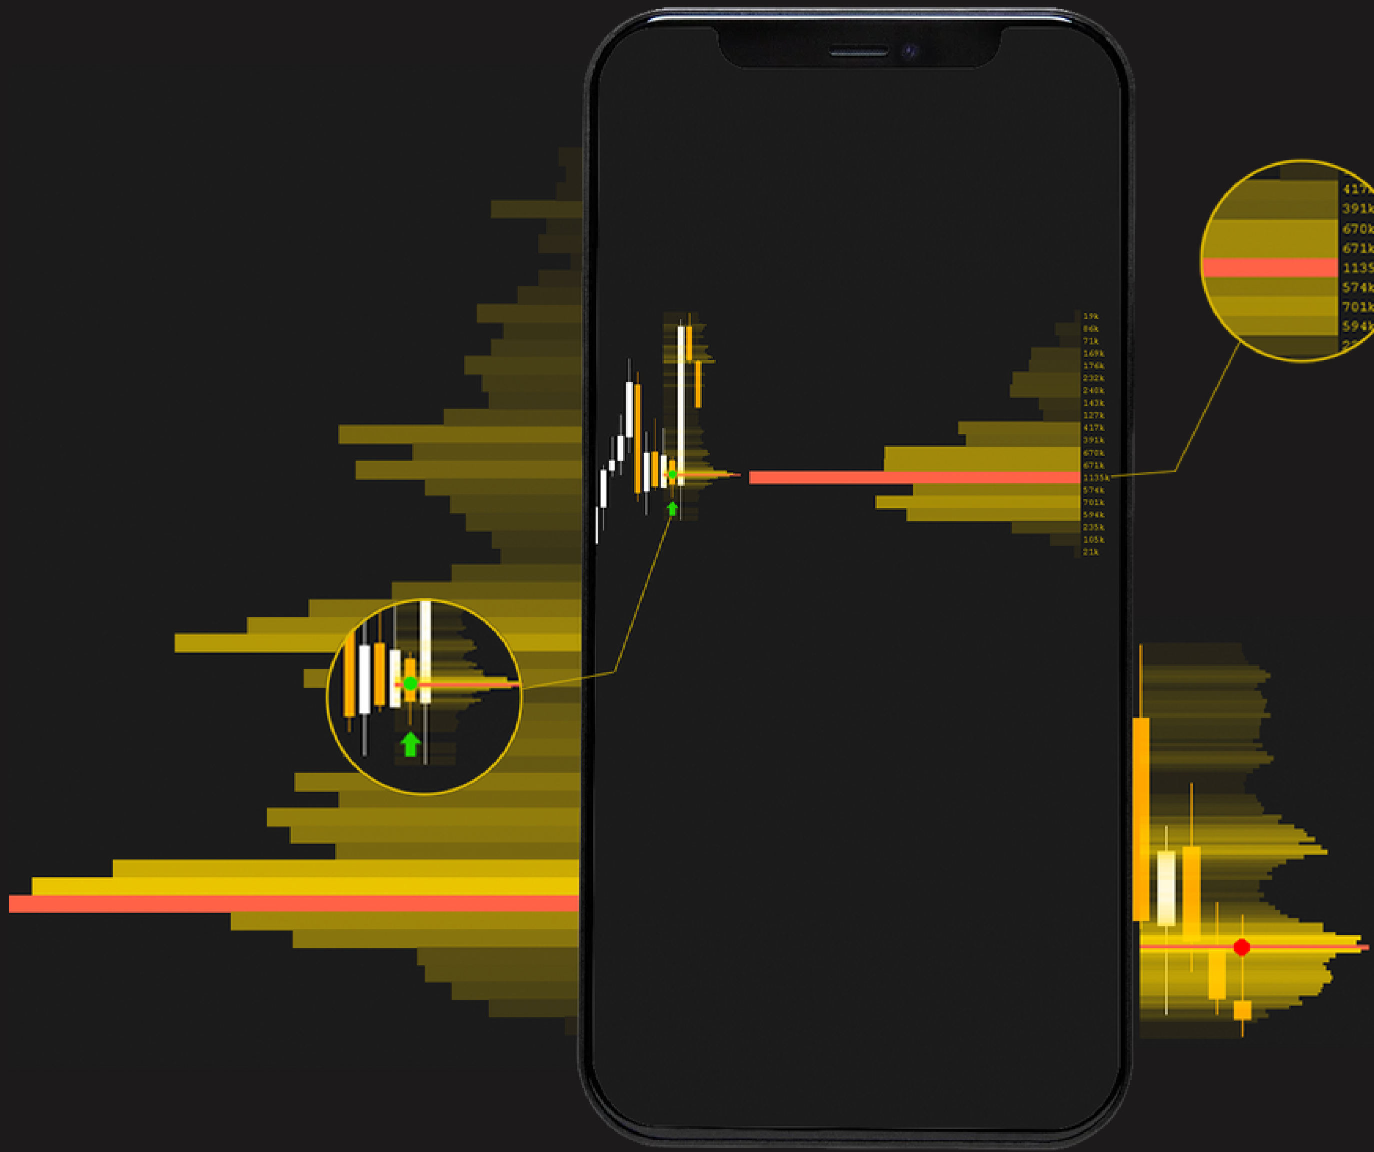
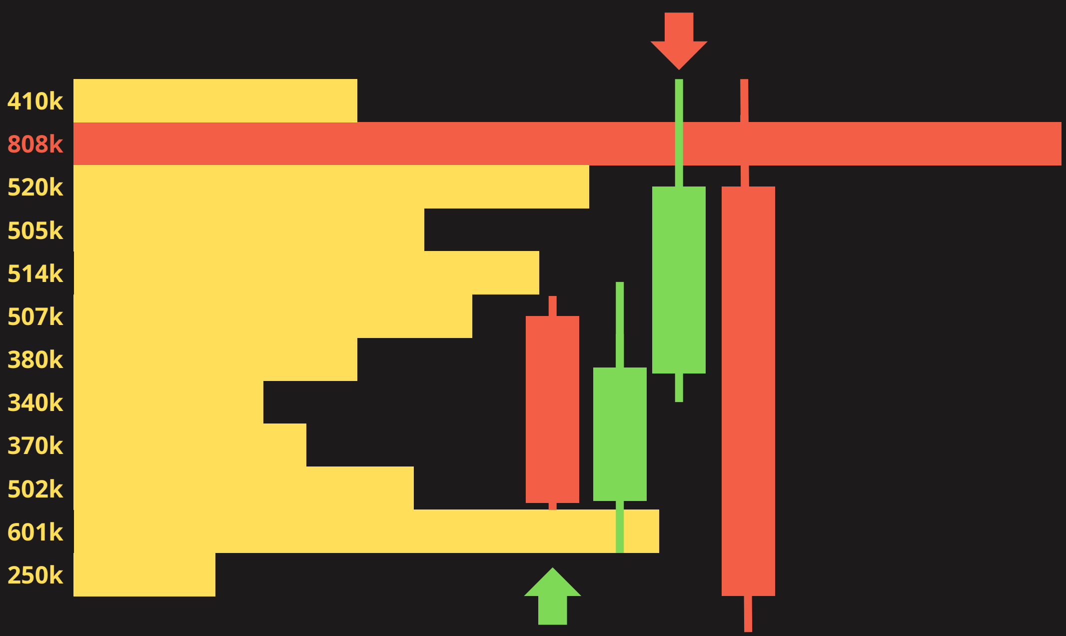
LIMTRADE INDICATOR





Let's start with the settings

Variable	Value
UserKey	
Per	15
AlertPer	2
ZoneType	Zone
ZoneColor	Gold
BigLevel	Tomato
Transparent	true
UpColor	Gold
DownColor	Gold
TextColor	Gold

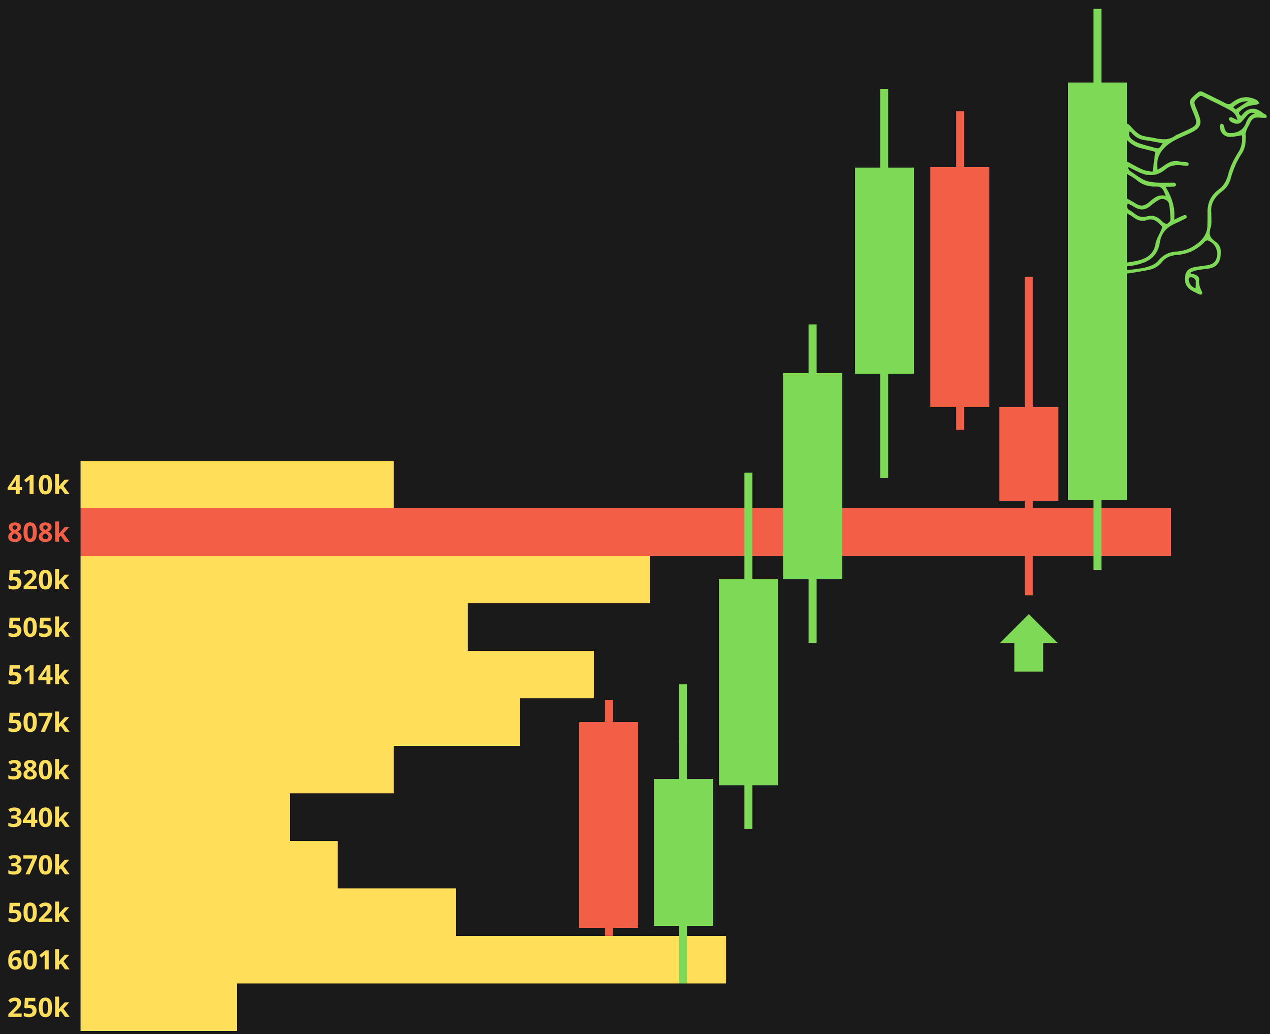
- UserKey - here you need to enter your activation key. Per
- is the period for which the indicator will accumulate global volume data. LocalPer is the period for which the
- indicator will accumulate local volume data. CorrectBars - the higher this value, the stronger the trend will be
- during the signals. But the signals themselves will become fewer.

- ZoneType - damage/volumes can be displayed in zone and line format.
- ZoneColor - color of lines/zones. BigLevel - the color of the
- largest level. Transparent - transparency of levels/zones.
- UpColor - signal color (if the price has approached the level
- from top to bottom)

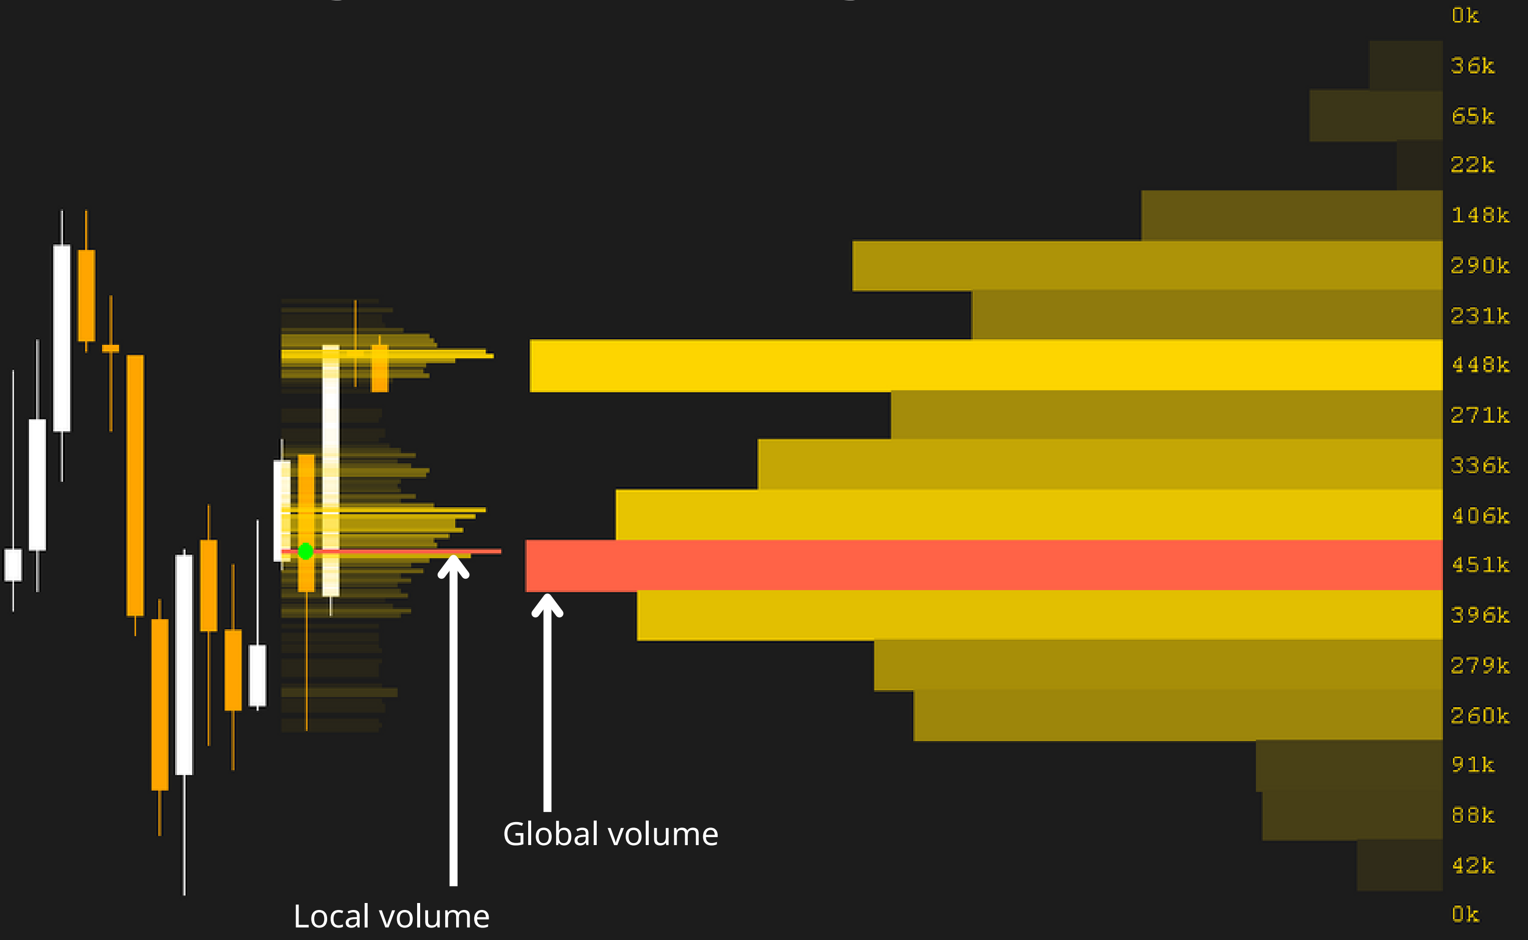
- DownnColor - signal color (if the price has approached the level from bottom to top)
- TextColor - the color of the volumes to the right of the zones.

Technical recommendations

- Recommended TF M5 (NO LOWER)
- Expiration time - 3-5 minutes.
- We cover news in 30 minutes and after 30 minutes (2 and 3 heads)
- Martingale maximum 1 knee. Any
- currency pairs are suitable.



Logic for entering a trade



BUY signal

The situation is turning aroundtowards the general trend (up)

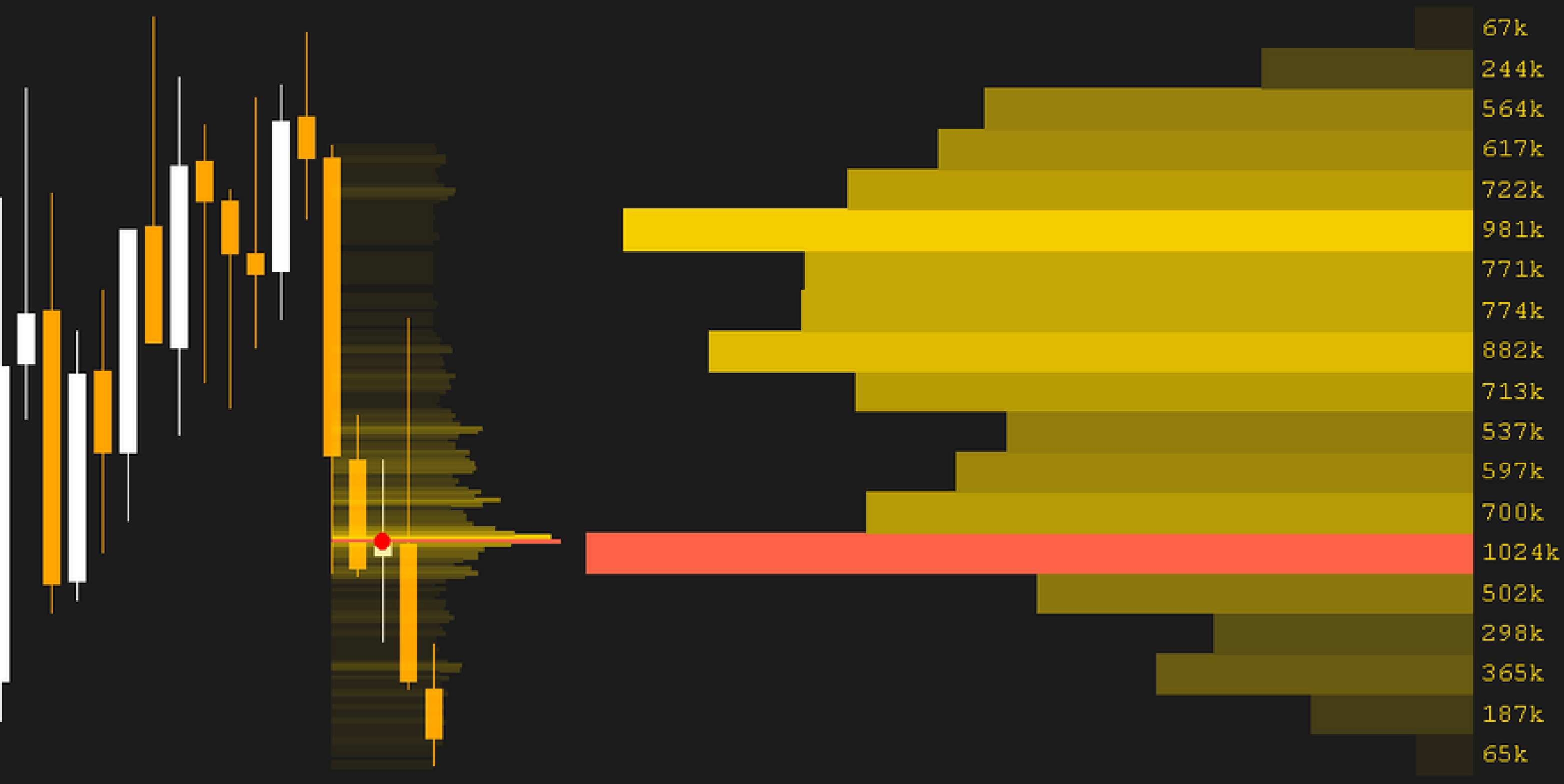
- Open 5 min TF
- The price approached the largest global volume (451,000 contracts) from top to bottom.
- Also, the price crossed the largest local volume (it is formed directly on the candles)
- A sound alert was received (when the level was touched)

Option 1.

We open an up trade immediately when the price touches the level for 3-5 minutes. We open a trade only in the direction of the general trend!

Option 2.

We open a trade up, upon the close of the 5-minute candle, with an expiration period of 3-5 minutes. We open a trade only in the direction of the general trend!



SELL signal

The situation is turning around towards the general trend (down)

- Open 5 min TF
- The price approached the largest global volume (1,024,000 contracts) from bottom to top.
- Also, the price crossed the largest local volume (it is formed directly on the candles)
- A sound alert was received (when the level was touched)

Option 1.

We open a downward trade immediately when the price touches the level for 3-5 minutes. We open a trade only in the direction of the general trend!

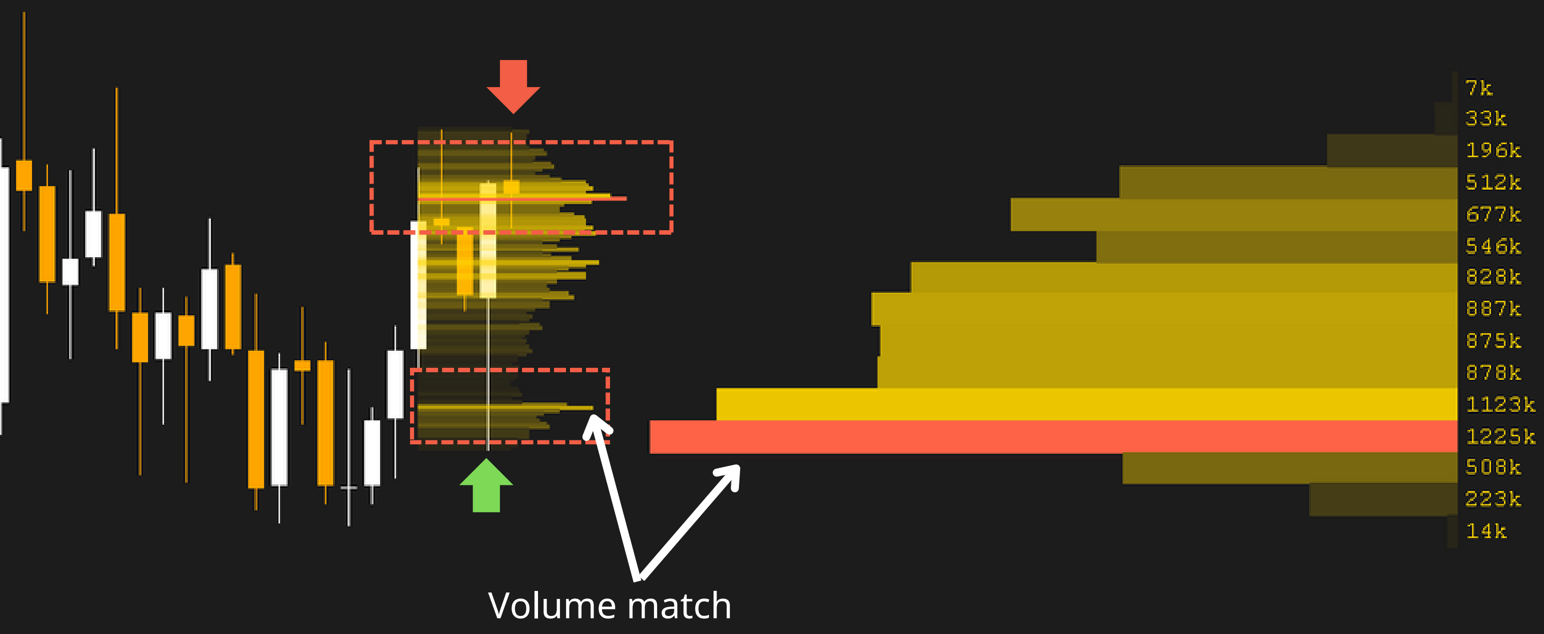
Option 2.

We open a trade down upon the close of the 5-minute candle, with an expiration period of 3-5 minutes. We open a trade only in the direction of the general trend!

A little analysis

Trade without waiting for signals!

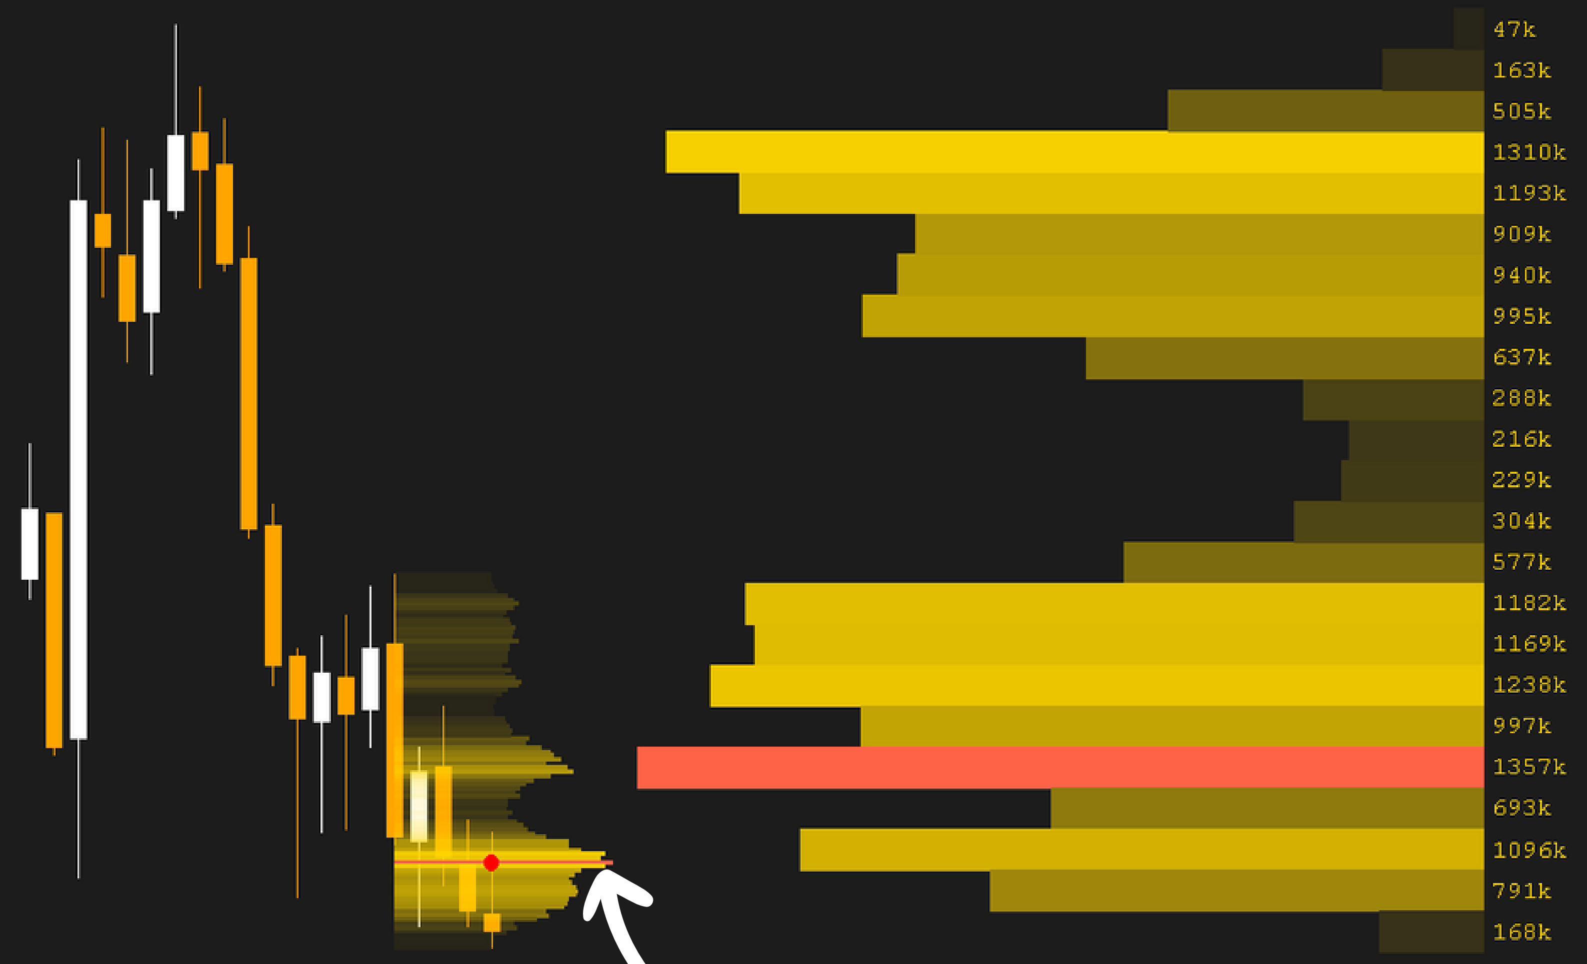
The indicator literally gives you a lot of situations for closing profitable transactions. It is important to understand that the indicator consists of two parts. These are global levels (located to the right of the chart) and local levels (located directly on the chart prices). And it is very important to “filter” the global levels - local and on the contrary, local ones become global.



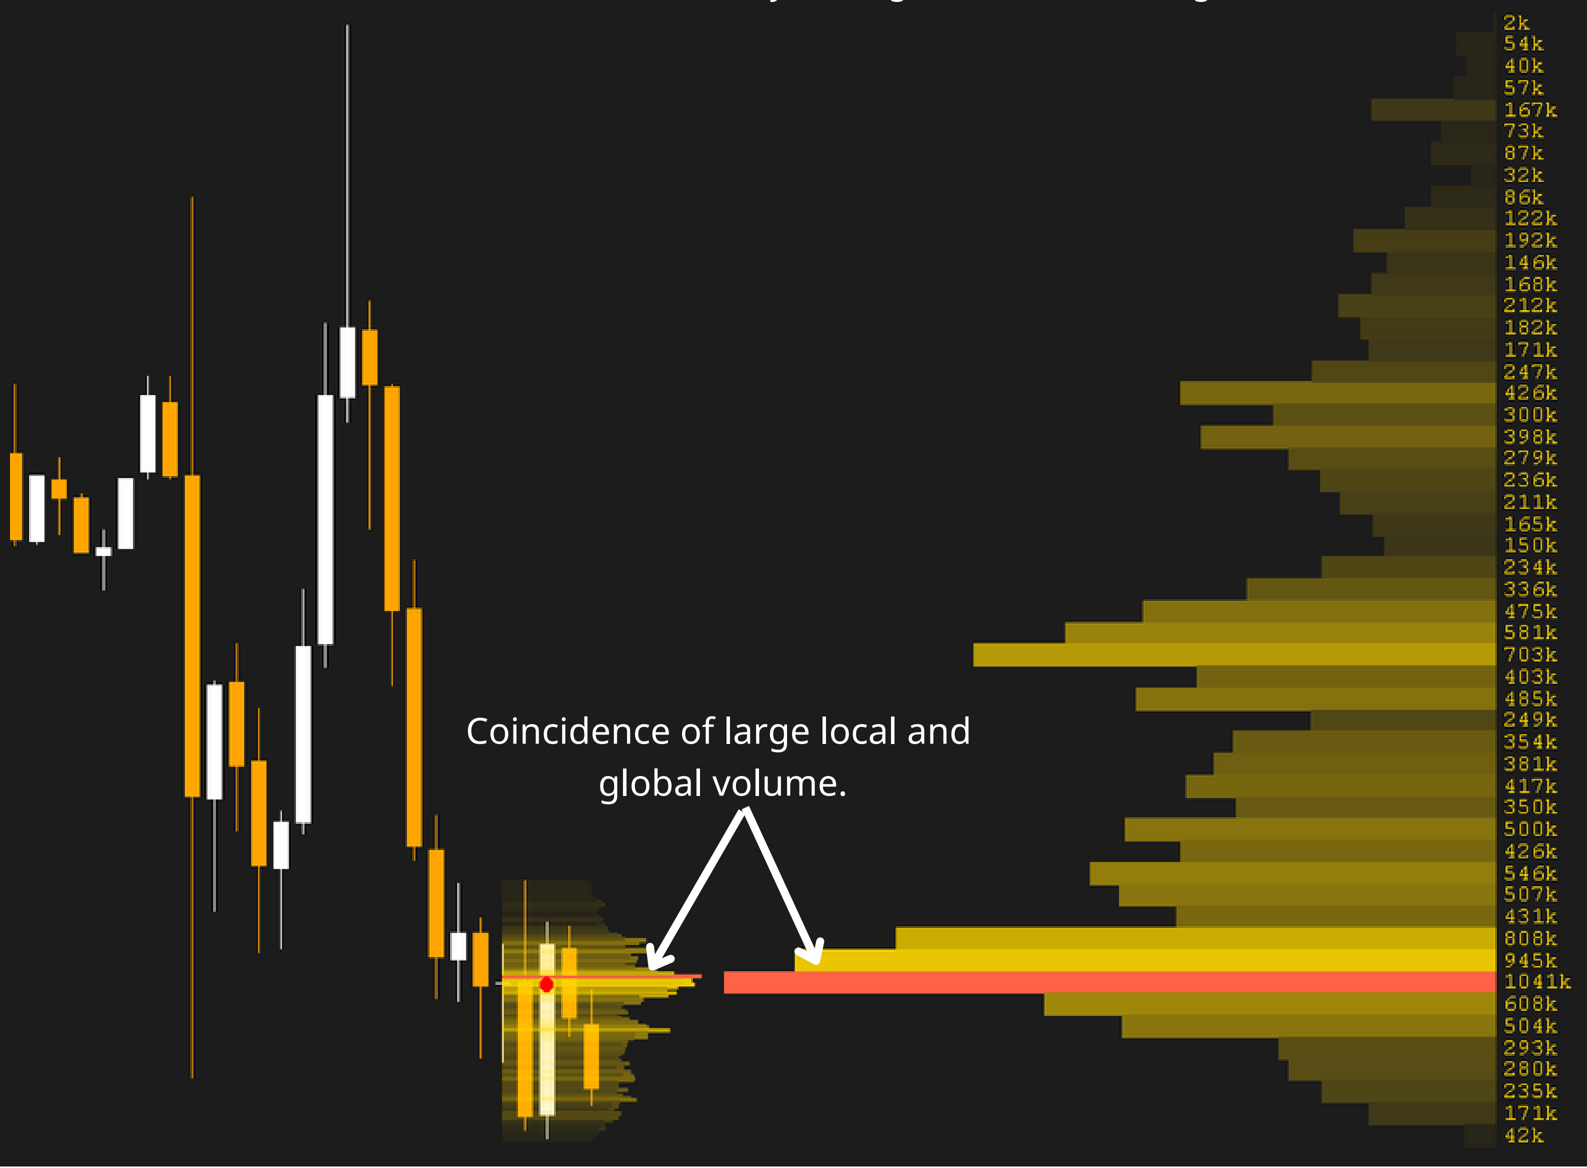
Look at the example above. What happened to the price?

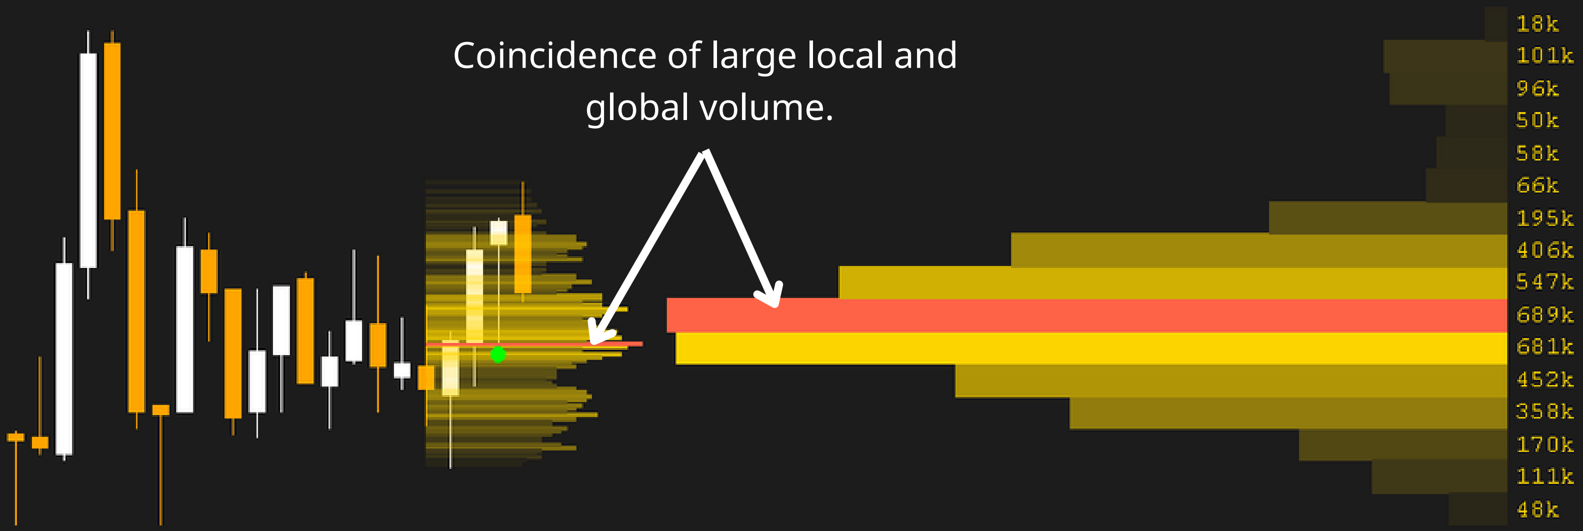
The market went down to the accumulation of local volume, as well as very It is important to note that at the level of local accumulation of volume a global level (1,220,500 contracts) was formed, after which the price bounced up, leaving behind a large bullish shadow.

Further, the market came up against a large local volume, where we would have opened a trade down! But in this case, there is no coincidence with the global volume on the right, as in the previous case.



A clear structure of volume accumulation is the key to a high chance of working out a deal.





Coincidence of large local and global volume.

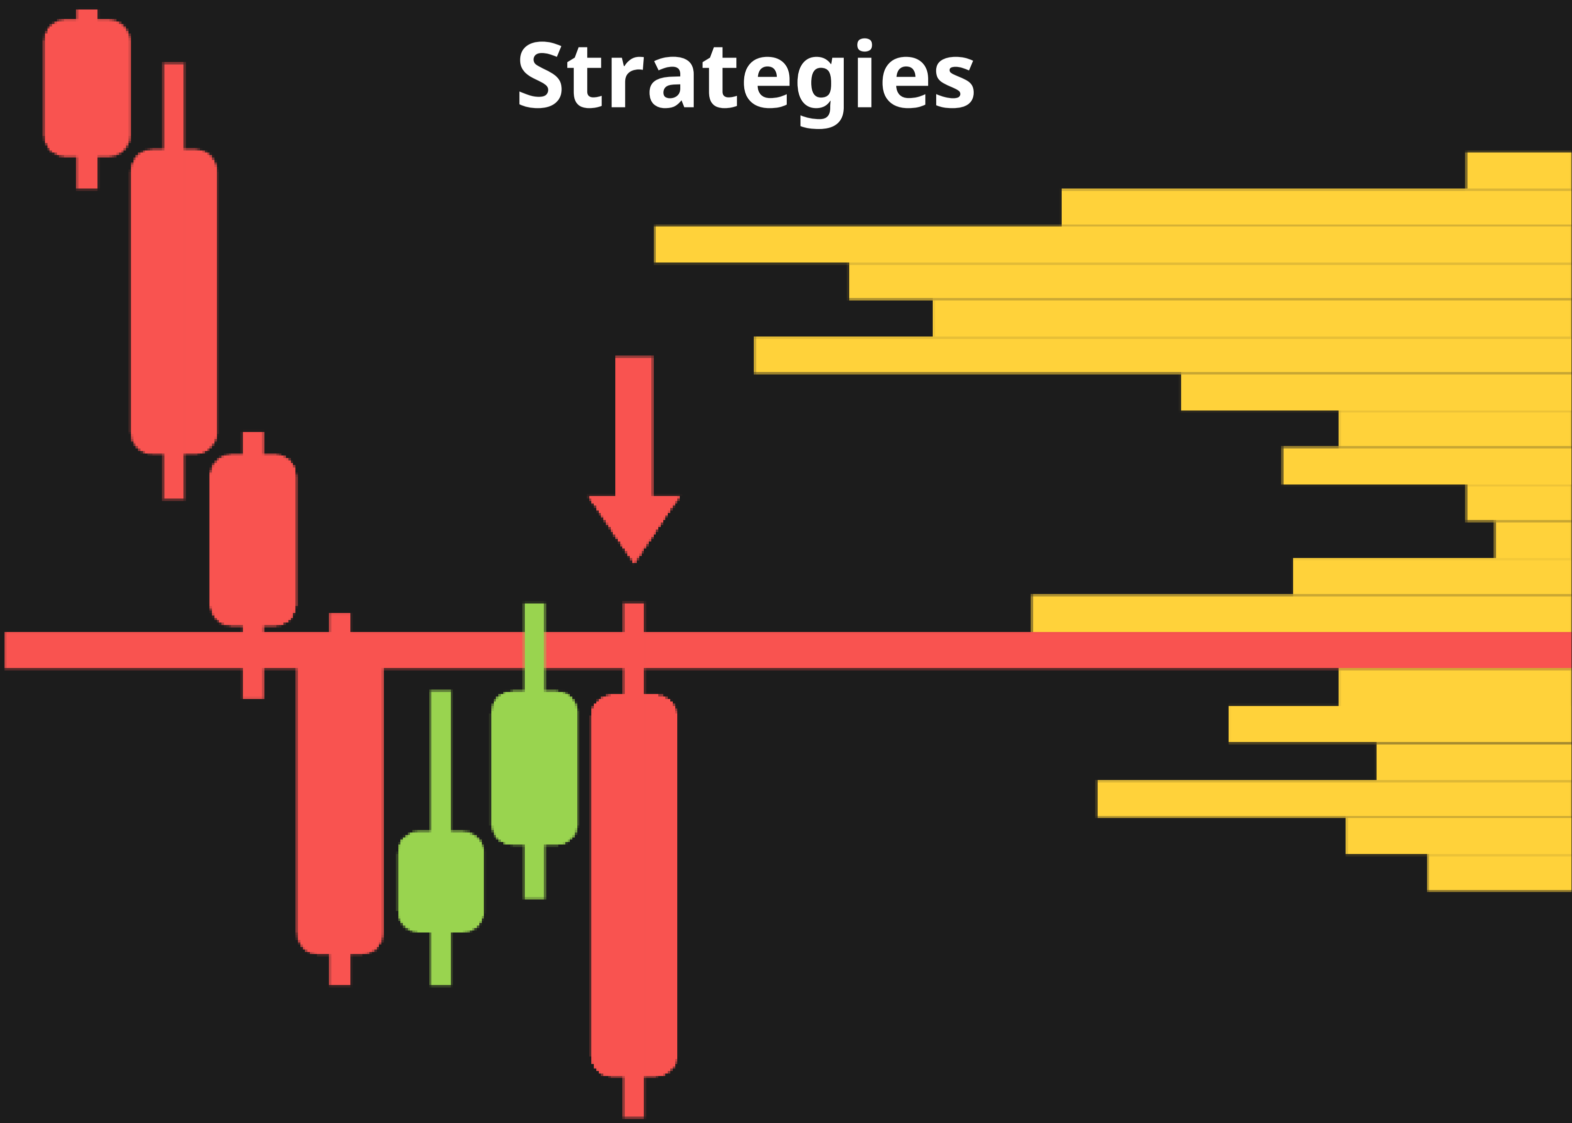
Strategies



SELL Signal

- Open 5 min TF
- The price has reached the largest volume. It would seem that there should be a rebound from the level upward! But no, the price broke through the level down.
- Next, we wait for the price to roll back to the level from bottom to top and open a deal at a retest of the level.

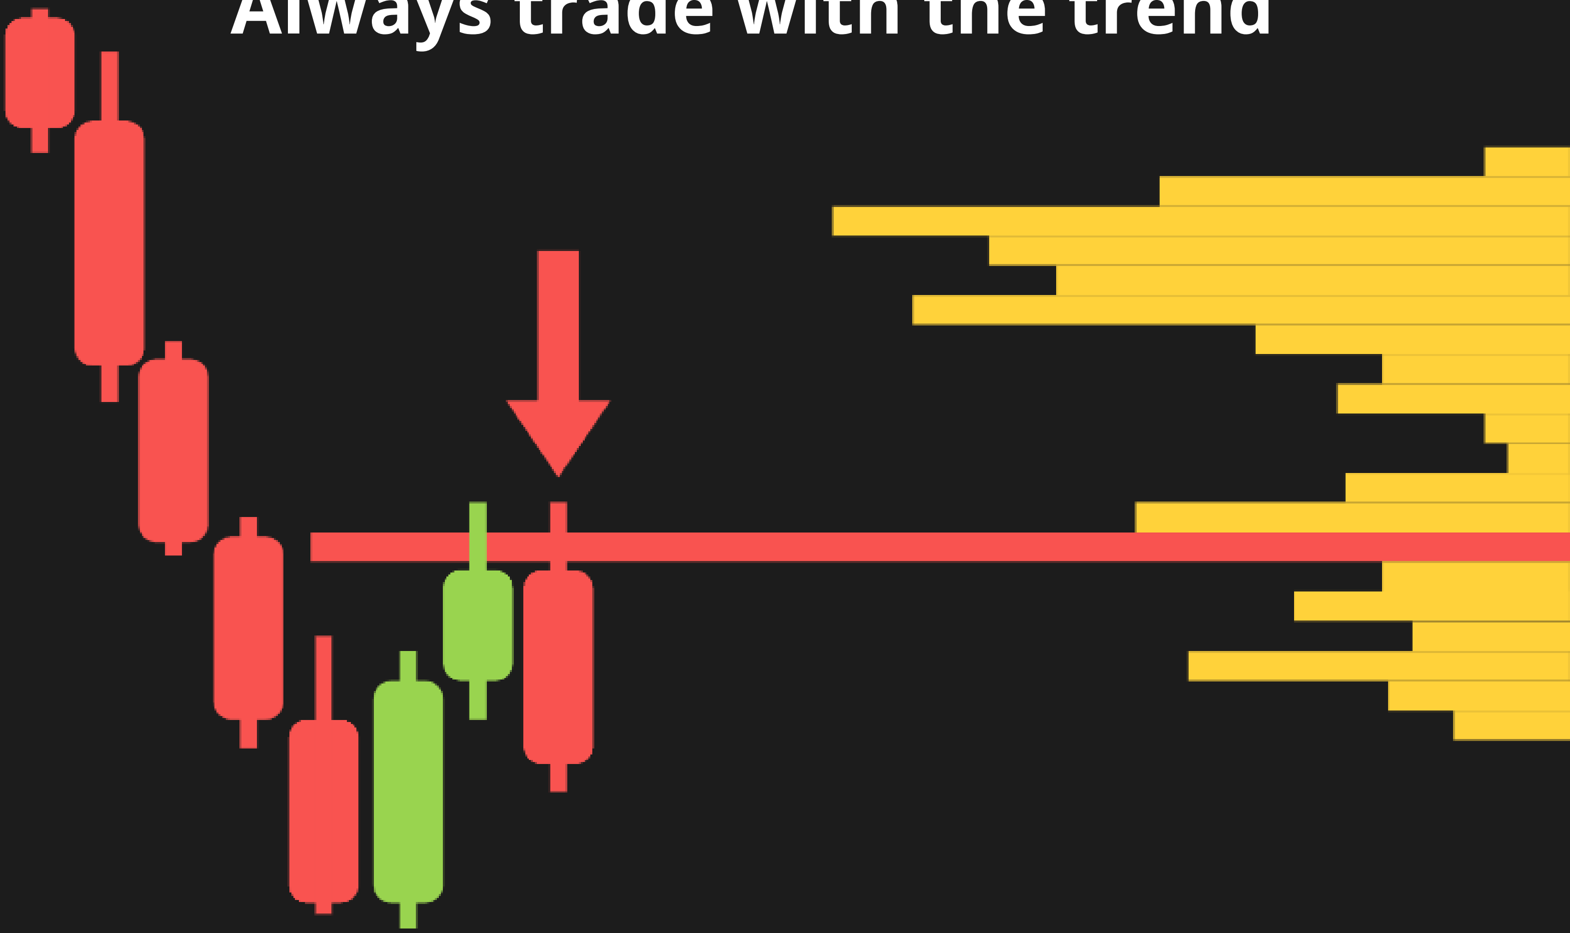
Option 1.

We open a downward trade immediately when the price touches the level for 3-5 minutes.

Option 2.

We open a trade down upon the close of the 5-minute candle, with an expiration period of 3-5 minutes.

Always trade with the trend



SELL Signal

- Open 5 min TF
- We are observing a downward movement.
- We enter into a trade only when the price rolls back to a large volume in the direction of the general trend.

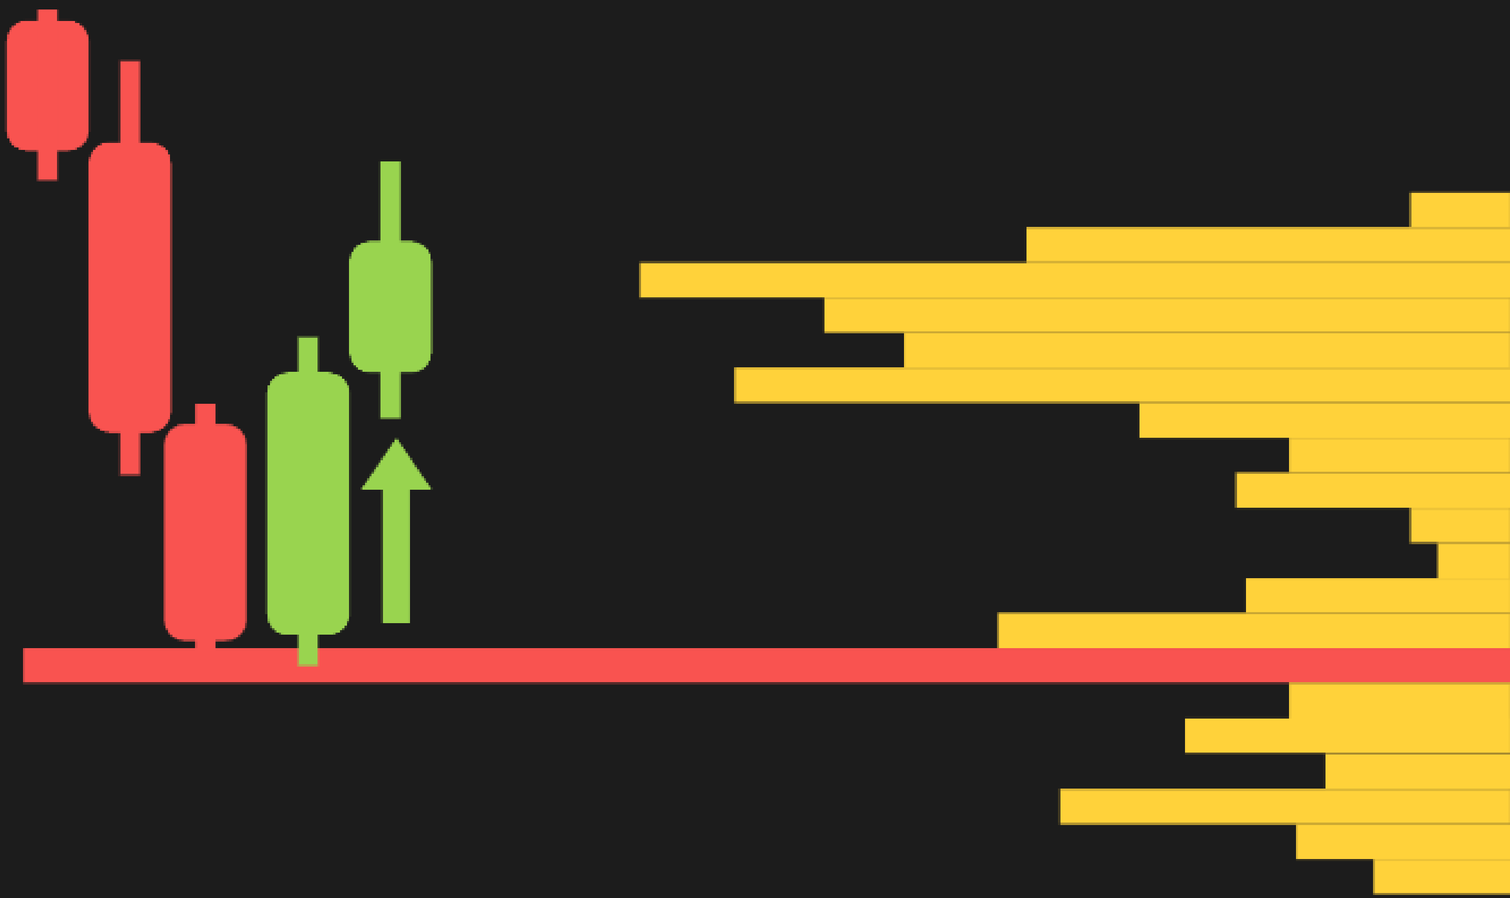
Option 1.

We open a downward trade immediately when the price touches the level for 3-5 minutes.

Option 2.

We open a trade down upon the close of the 5-minute candle, with an expiration period of 3-5 minutes.

Wait for confirmation



One of the methods of opening a transaction is “confirmation”; we enter a transaction only if we see a positive price reaction to the level. In the above example, the trade is not entered immediately, but only on the next candle.

The logic of the method is that in this way you can avoid false entries and open trades only from “confirmed” levels.

After all, if we see a large level, it is not always that it matters and arouses the interest of players. In this case, a good method is to wait for a “reaction”, “confirmation”. You will clearly see this from the market/price behavior around a large level.
