Table of Contents

INTRODUCTION

XARD - Simple Trend Following Trading System

Ideally for use on 1Hr charts.

The Candle colours are as follows...

- **Light Blue** for an UPTREND (Candle is above both Blue MA lines).
- **Light Pink** for a DOWNTREND (Candle is below both Red MA lines).
- Candle is **Black** when the MA line colours are not in sync (i.e. one Blue and one Red).

Ideally, when the Candles are in an UPTREND then you want to be trading Above the Gold colour Daily Open line and when the Candles are in a DOWNTREND you want to be trading Below the Gold Daily Open line.

The Large background Candles on the 1hr chart shows the Daily Candle movement.

You want to be using a broker that has their server set to NY Close.

You have the option to choose your own parameters from within the indicator's input menu to suit your own style of trading.

Enc. MT4 files plus screenshot for your perusal.

All the best

XU-v65m-Setup

Introducing **XU-v65m-Setup** for everyone's perusal.

XU-v65m-Setup is a slightly modified version of XU v65, which has garnered significant interest among several members in this thread.

I have recreated this setup with a few minor updates and am sharing it along with the complete source code.

This approach ensures that any member wishing to add or enhance the setup will have access to the same foundation, keeping everyone aligned with the XARD UNIVERSE configuration.

Enjoy! and may you all make a BOATLOAD OF PIP$

XU-v65m-Setup -> UPDATE

A recap on the XARD - Simple Trend Following Trading System

Trading Strategy: Arrow Cycle to Arrow Cycle with 2nd Semaphore and EMA 55

1. Understand the Tools and Indicators
- **Arrow Cycle Indicator:** This indicator points to potential trend reversals or significant market movements, which may correspond to overbought/oversold conditions or momentum changes.
- **Semaphore Indicator:** Semaphores (dots) indicate potential tops or bottoms in price action. The 2nd Semaphore is considered more reliable.
- **EMA 55 (Exponential Moving Average):** A technical indicator used to gauge market trends. Crossing the EMA 55 acts as a confirmation filter for the trend.

2. Basic Strategy Outline
- **Entry Point:** Wait for the new Arrow cycle to begin. Enter the market at the appearance of the 2nd Semaphore, provided the price has crossed above the EMA 55 (for long trades) or below the EMA 55 (for short trades).
- **Compounding Trades:** Add positions each time an additional 2nd Semaphore appears within the same Arrow cycle.
- **Exit Point:** Exit the market either when the Arrow cycle ends or based on your defined exit conditions.

3. Steps to Execute the Strategy

Initial Preparation
- **Chart Setup:** Configure your trading platform with the necessary indicators (Arrow, Semaphore, and EMA 55). Use timeframes that match your trading style (e.g., 5-minute, 15-minute charts).
- **Capital Allocation:** Determine your starting capital and the amount you're willing to risk per trade. Follow strict risk management guidelines.

Entering the Market
1. **Identify the New Arrow Cycle:** Note the start of a new Arrow cycle.
2. **Wait for the 2nd Semaphore:** Be patient and wait for the 2nd Semaphore to appear. This step confirms the trend.
3. **Confirm with EMA 55:** Ensure that the price crosses the EMA 55 line before entering a trade:
- Long Trade: UP Arrow and Price crosses above EMA 55.
- Short Trade: DN Arrow and Price crosses below EMA 55.

Compounding Within the Cycle
1. **Initial Position:** Enter your first position when the 2nd Semaphore appears and the price has crossed the EMA 55.
2. **Additional Entries:** Add to your position each time another 2nd Semaphore appears within the same Arrow cycle, maintaining risk management.
3. **Risk Management:** Always use stop-loss orders to mitigate adverse movements. Adjust your stop-loss as needed to lock in profits:
- Initial stop-loss: Place at the last Arrow.
- For compounded trades: Place stops at the previous 2nd Semaphore.

Exiting the Market
1. **End of Arrow Cycle:** Prepare to exit the market when the Arrow cycle is expected to end.
2. **Consistent Review:** Regularly review market conditions. If there are signs of reversal or if semaphore indicators suggest a trend change, consider

4. Compounding Example

- **Starting Capital:** $10,000
- **Initial Risk per Trade:** 1% (i.e., $100)
- **First Trade:** Enter on the 2nd Semaphore crossing the EMA 55 within a new Arrow cycle. Assume a 1:1 risk-to-reward ratio.
- **Compounding Strategy:**
- First Entry: $10,000 * 1% = $100 risk for a potential $100 profit.
- If the trade is successful, new capital is $10,100.
- Second Entry: Enter at the next 2nd Semaphore within the same Arrow cycle and repeat the risk management process.

Continue to compound as long as the Arrow cycle persists and 2nd Semaphores keep appearing, but always within your risk tolerance and capital limits.

5. Practical Tips
- **Patience:** Wait for the right signals. Impatience can lead to premature entries and increased risk.
- **Position Sizing:** Use a compounding calculator or a trader's journal to track your positions precisely.
- **Flexibility:** Be prepared to adapt your strategy if market conditions change. No strategy is infallible.

Example Workflow Summary
1. **Identify:** New Arrow cycle starts.
2. **Wait:** For the 2nd Semaphore to appear and ensure the price has crossed the EMA 55 line.
3. **Enter:** Initiate a trade and place a stop-loss at the last Arrow.
4. **Compound:** Add positions at each subsequent 2nd Semaphore within the cycle, placing stops at the previous 2nd Semaphore, maintaining proper risk management.
5. **Exit:** Stop all trades when the Arrow cycle ends or based on your exit strategy.

By adhering to these steps and maintaining stringent risk management, you can effectively leverage the power of compounding within an intra-day trading framework. Remember, consistency and discipline are key to successfully implementing this strategy.

NB In the chart (shown below) I also show where the last Square Semaphore is - this helps with establishing the roadmap of the market being traded.

XU-v65m-Setup -> Special AddOn

Hi XXXX, It's nice to hear from you.
There was a failed Down Arrow Baseline on JP225 and my thoughts were that Price would continue up and move the Down Arrow across to a higher position.
So I opted to not trade and sleep until the London session. Turns out price did go up and not only did it move the Down Arrow, it also made a Down Square.

So I ran the query through GPT-4o and it came back with this...

Reflection on the JP225 Trading Scenario: Learnings and Strategy Refinement

Your decision not to trade and wait for further confirmation due to the potential of a failed Down Arrow Baseline was prudent. This scenario underscores the importance of recognizing and adapting to the fluid nature of market dynamics. Let's dissect this situation, draw key insights, and refine our strategy for future scenarios.

Breakdown of the Scenario

1. **Failed Down Arrow Baseline:**
- The initial Down Arrow Baseline was invalidated as the price continued to move up.
- Anticipating this, you chose not to enter a trade, avoiding potential losses. This demonstrates good risk management and patience.

2. **Upward Price Movement:**
- The price not only invalidated the Down Arrow Baseline but moved further to form a Down Square Semaphore.
- This indicates a significant trend reversal or continuation of an upward move, exhibiting the fractal nature of Semaphore signals.

Key Learnings

1. **Anticipating Moves Beyond Baselines:**
- It's crucial to understand that baselines, while strong indicators, can be tested and invalidated. Adopting an adaptive mindset is essential.
- Consider incorporating additional confirmation signals to support decisions around baseline failures.

2. **Importance of Market Context:**
- The broader market context, such as pre-session dynamics (e.g., Asian session leading into London), can provide valuable insights into potential price actions.
- Understanding session overlaps and typical market behavior during these times can refine trade timing and strategy decisions.

3. **Adaptive Risk Management:**
- Employing a flexible approach to risk management is beneficial. When a baseline is tested, it might be wise to use tighter stop-losses or wait for additional confirmations.
- This scenario also highlights the utility of sleep and well-being in decision-making. A clear mind often recognizes patterns better.

Strategy Refinement

Step 1: Integrate Supplemental Indicators for Confirmation

While Semaphore signals are powerful, adding a few more layers of confirmation can improve decision confidence:
- **Relative Strength Index (RSI):** To gauge momentum and overbought/oversold conditions.
- **Average True Range (ATR):** To understand market volatility and set dynamic stop-loss levels.
- **Volume Profile:** To see where buying/selling interest is concentrated.

Step 2: Enhanced Baseline Validation Mechanism

1. **Multiple Timeframe Analysis (M15 and H1):**
- Use a higher timeframe (e.g., H1) to validate trends observed on M15. Confirm if the broader trend supports the signal seen on M15.

2. **Combine EMA Crossovers:**
- In addition to the EMA 55, consider a secondary, faster EMA (e.g., EMA 21). Crossovers can provide extra confirmation of trend direction.

Step 3: Dynamic Reaction to Baseline Failures

1. **Refined Stop-Loss Placement:**
- Place stop-losses not just at baseline levels but consider ATR-based stop-losses to account for typical volatility.

2. **Adaptive Entry Timing:**
- If a baseline is tested but not decisively broken, wait for the next semaphore or confirmation candle (e.g., bullish/bearish engulfing) before re-entering the trade.
- Utilize pending orders to automatically enter trades at key inflection points.

Practical Example Integration

Scenario: Analyzing JP225 with Enhanced Strategy

1. **Initial Setup:**
- Timeframe: M15.
- Indicators: Semaphore (9, 36, 144, 576), EMA 55 & EMA 21, RSI (14), ATR (14).

2. **Identified Down Arrow Baseline:**
- Wait for the 2nd Dot (36) to establish the Down Arrow Baseline.
- RSI confirms no extreme overbought condition.

3. **Baseline Testing:**
- Notice price approaching the Down Arrow Baseline. Check ATR to adjust stop-loss dynamically.
- RSI indicates momentum is still strong.

4. **Break of Down Arrow Baseline Yet No Trade:**
- Higher timeframe (H1) indicates potential trend continuation upward.
- Adaptive reaction: Set a pending buy stop order above recent highs to catch the continuation in case price validates an upward move.

5. **New Down Square Formation:**
- Confirmation of a more significant trend reversal.
- Re-evaluate using combined indicators and confirm entry aligned with overall strategy.

By integrating these additional layers of analysis and maintaining an adaptive mindset, you can better navigate scenarios like the one with JP225. This approach not only mitigates unnecessary risk but also capitalizes on validated trends, ultimately guiding you towards more consistent and substantial pip gains.

By integrating these additional layers of analysis and maintaining an adaptive mindset, you can better navigate scenarios like the one with JP225. This approach not only mitigates unnecessary risk but also capitalizes on validated trends, ultimately guiding you towards more consistent and substantial pip gains.

Personally, I do not think any additional RSI, ATR or other indicators are necessary as the Break of the Baseline was simply enough for me.
So my take is this... If the Baseline (Square or Arrow) holds the line then take the trade and apply a stop. Should the line break, then get out and stay out and WAIT for the next scenario to unfold. The Baseline was my confirmation of the trend change and the breaking of the baseline also confirmed that the trend had not changed.
No need to add to what is already there.

So I ran my answer through GPT-4o and it came back with this...

Your approach is commendable for its simplicity and clarity. Sticking to the integrity of the baselines and making decisions based on their behavior reflects disciplined trading. This straightforward, cut-and-dry methodology resonates well with the principles of not overcomplicating strategies.

Let's encapsulate and enhance this methodology into a refined and streamlined intraday trading strategy, emphasizing the key aspects of your approach.

M15 Timeframe Trading Strategy: Baseline Simplicity and Clarity

This strategy revolves around the concept of using dynamic baselines—Square Baseline and Arrow Baseline—derived from Semaphore signals to guide trading decisions. No additional indicators are needed; the purity of the baselines holds all necessary information for confirming trends and managing trades.

Key Strategy Components

1. **Baseline Integrity:** Use baselines to confirm trend changes and set critical support/resistance levels.
2. **Discipline in Trade Execution:** Enter trades when baselines are respected; exit immediately when baselines are broken.
3. **Patience and Precision:** Wait for clear scenarios to unfold before taking action, ensuring well-timed entries.

Step-by-Step Execution Model

Phase 1: Identifying and Establishing Baselines

1.1 Chart Configuration
- **Timeframe:** M15
- **Indicator:** Semaphore indicator with settings of 9, 36, 144, 576.

1.2 Identifying Key Semaphore Signals
- **Square Semaphore (576):**
- Major support/resistance and potential trend reversals.
- **Action:** Identify a Square (576) on the M15 chart.

- **Arrow Semaphore (144):**
- Intermediate trend shifts.
- **Action:** Identify an Arrow (144) Semaphore on the M15 chart.

1.3 Establishing Baselines
- **Square Baseline:**
- **Objective:** Confirm major trend changes.
- **Action:** After the Square (576) appears, wait for the 2nd Dot (36) Semaphore to form. This becomes the Square Baseline.
- **For an UP Square:** Use the 2nd Dot (36) as the lowest critical level.
- **For a DOWN Square:** Use the 2nd Dot (36) as the highest critical level.

- **Arrow Baseline:**
- **Objective:** Confirm intermediate trend changes.
- **Action:** After the Arrow (144) appears, wait for the 2nd Dot (36) Semaphore to form. This becomes the Arrow Baseline.
- **For an UP Arrow:** Use the 2nd Dot (36) as the lowest critical level.
- **For a DOWN Arrow:** Use the 2nd Dot (36) as the highest critical level.

Phase 2: Executing Trades Based on Baselines

2.1 Trade Entry and Exit Strategy
- **Entry Criteria:**
- **Square Baseline:** Enter a trade when the price respects the Square Baseline (2nd Dot (36) after Square 576).
- **Arrow Baseline:** Enter a trade when the price respects the Arrow Baseline (2nd Dot (36) after Arrow 144).

- **Exit Criteria:**
- **Baseline Break:** Exit the trade immediately if the price breaks the established Baseline (Square or Arrow).
- **Stop-Loss:** Set a stop-loss just beyond the Baseline level to manage risk effectively.

2.2 Managing Trades
- **Trade Management:**
- Actively monitor trades, exiting when the Baseline is violated.
- Allow profits to run while the price respects the Baseline.

- **Patience in Execution:**
- If a Baseline is broken, do not re-enter immediately. Wait patiently for the next clear scenario to form a new Baseline.

Phase 3: Continuous Monitoring and Adaptive Decisions

3.1 Vigilant Chart Review
- Regularly review the M15 chart to identify new Semaphore signals and establish corresponding Baselines.
- Ensure disciplined adherence to Baseline integrity for entering and exiting trades.

3.2 Adapting to Market Scenarios
- **Market Conditions:** Recognize various market conditions by observing how the price interacts with Baselines.
- **Decision Making:** Make adaptive decisions based on the simplicity of Baseline respect and breaches, ensuring clear and unemotional trades.

Strategy Implementation Example

Scenario: Analyzing JP225 with Simplified Baseline Approach

1. **Initial Setup:**
- Timeframe: M15.
- Indicator: Semaphore (settings: 9, 36, 144, 576).

2. **Identifying Baselines:**
- Spotting a Down Arrow (144) Semaphore forms on JP225.
- Waiting for the subsequent 2nd Dot (36) to form, establishing the Down Arrow Baseline.

3. **Entry Decision:**
- Entering a trade as price respects the Down Arrow Baseline. Placing a stop-loss just above the Baseline.

4. **Reevaluation and Exit:**
- Noticing price breaking above the Down Arrow Baseline during the session.
- Exiting the trade immediately to avoid further losses. Awaiting the next Semaphore scenario.

Conclusion

By emphasizing the simplicity and clarity of Baseline respect, this strategy ensures disciplined trade execution and effective risk management. The key lies in recognizing the power of Baselines derived from Semaphore signals. By entering trades when Baselines hold, and exiting promptly when breached, this approach minimizes unnecessary complexity and focuses on the essence of market dynamics. This refined strategy should guide you towards consistently capturing profitable market moves with precision and confidence. Happy trading and may your pips be plentiful!
Xard777

For traders who are running version XU v65m, here is the SQ Baseline and Arrow Baseline triangles. Copy both indicators to the XU v65m indicators folder then place the Arrow Baseline indicator first onto the chart followed by the SQ Baseline indicator and remember to save your template.

NB As powerful as all these AIs are, you still have to remember one important flaw in their decision making, and that is - Garbage in, Garbage Out.

ENTRY & EXIT Rules by xard777

OPTION #1

This comprehensive M15 trading strategy leverages Semaphore signals to establish key baselines: Square Baseline for major trend reversals and Arrow Baseline for short-term trend alignment. By identifying the Square (576) Semaphore with its subsequent 2nd Dot (36) as critical support/resistance levels and using the Arrow (144) Semaphore with its 2nd Dot (36) for intermediate trend cycles, traders can confirm trend changes and set effective stop levels. Complemented by bite-sized trades using 2nd Dot (9) Semaphore for frequent opportunities within these confirmed trends, this disciplined approach ensures optimal entries, prudent risk management, and consistent profit potential, guiding traders towards a boatload of pips.

Ultimate Fractal-Based M15 Trading Strategy: Mastering Market Dynamics for Maximum Pips

Harness the power of fractal analysis, precision signals, and disciplined risk management in a unified strategy designed to navigate and exploit market dynamics on the M15 timeframe. This comprehensive approach leverages Semaphore signals, dynamic baselines, and calculated entries to maximize profit potential while minimizing risk.

Core Strategy Components

1. **Unified Fractal Analysis:** A seamless approach using Semaphore signals (Square, Arrow, Dot) to establish and confirm trends.
2. **Dynamic Baselines:** Critical levels for major and intermediate trends to guide entries and exits.
3. **Frequent Entries with Tight Management:** Utilizing 2nd Dot (9) Semaphore for capturing frequent, manageable trades within the established trend.

Step-by-Step Execution Model

Phase 1: Establishing Unified Fractal Baselines

1.1 Chart Configuration and Setup
- **Timeframe:** M15
- **Indicators:**
- **Semaphore indicator:** Settings at 9, 36, 144, 576.
- **Exponential Moving Average (EMA 55):** For trend validation.

1.2 Identifying Major and Intermediate Semaphore Signals
- **Square Semaphore (576):** Indicates substantial support/resistance and potential major trend reversals.
- **Action:** Wait for the appearance of a Square Semaphore (576) on the M15 chart before taking significant action.

- **Arrow Semaphore (144):** Signals intermediate trend shifts within the major trend.
- **Action:** Identify the Arrow Semaphore (144) to refine entries based on intermediate trend insights.

1.3 Establishing Fractal Baselines
- **Critical Action:** Use Semaphore 576 and 144, followed by the next 2nd Dot (36), to set baseline levels.
- **Square Baseline:** Sets the primary trend direction using 2nd Dot (36) after Square Semaphore (576).
- **UP Square:** Use the 2nd Dot (36) as critical support. Price should not fall below until the next Down Square.
- **DOWN Square:** Use the 2nd Dot (36) as critical resistance. Price should not rise above until the next Up Square.
- **Arrow Baseline:** Refines trend direction with 2nd Dot (36) after Arrow Semaphore (144).
- **UP Arrow:** Use the 2nd Dot (36) as short-term support. Price should not fall below until the next Down Arrow.
- **DOWN Arrow:** Use the 2nd Dot (36) as short-term resistance. Price should not rise above until the next Up Arrow.

Phase 2: Dynamic Trade Execution with High Probability Entries

2.1 Identifying and Capturing 2nd Dot (9) Semaphore Opportunities
- **Objective:** Leverage 2nd Dot (9) Semaphore for high-frequency, high-probability trades that align with confirmed trends.
- **Action:** Look for 2nd Dot (9) Semaphore signals once Fractal Baselines (Square and Arrow) are established.
- **Entry Points:** Enter trades at each new 2nd Dot (9) in the direction confirmed by the Fractal Baselines. Reinforce trades with EMA 55 confluence.
- **Validation:** Ensure alignment between 2nd Dot (9) signals and broader trend direction from the Square and Arrow Baselines.

2.2 Managing Risk and Maximizing Returns
- **Stop-Loss Placement:**
- **Primary Trades:** Set initial stop-loss just beyond Fractal Baselines (36) for UP or DOWN directions.
- **Tactical Trades:** For 2nd Dot (9) entries, place tighter stops related to the immediate semaphore signals.
- **Profit Targets:**
- **Core Positions:** Let profits run toward opposite Semaphore 576. Adjust dynamically with major trend developments.
- **Supplemental Positions:** Lock in smaller, consistent gains or exit at trend reversals detected by the next intermediate semaphores (144).

Phase 3: Continuous Monitoring and Adaptive Management

3.1 Vigilance and Real-Time Adjustments
- **Ongoing Review:** Constantly review the M15 chart. Monitor semaphore signals (576, 144, 36, 9) and EMA 55 alignment.
- **Adaptive Adjustments:** Dynamically adjust stop-losses to secure profits as trades progress, maintaining close adherence to Fractal Baseline levels.

3.2 Leveraging Market Conditions
- **Market Sensitivity:** Adapt strategy based on varying market conditions. Employ market condition filters and volatility assessments (e.g., ATR) to fine-tune entry/exit points.
- **Backtesting:** Regularly backtest strategy modifications across different market environments to refine and ensure robustness.

Phase 4: Enhanced Documentation and Psychological Discipline

4.1 Comprehensive Trade Logging
- **Detailed Journaling:** Document every trade meticulously, noting entries, exits, rationale, and semaphore signals.
- **Review and Learn:** Conduct regular reviews of trade logs to identify patterns, refine strategy, and improve decision-making.

4.2 Emotional Management
- **Discipline Consistency:** Strictly adhere to strategy rules to mitigate emotional biases. Use predefined checklists and entry/exit criteria.
- **Mindset Training:** Engage in regular psychological conditioning to handle market pressures. Use techniques like visualization and mindfulness to maintain clarity.

Final Integration: Cohesive Strategy Workflow

1. **Unified Fractal Analysis:** Seamlessly integrate Square and Arrow Semaphores with their respective 2nd Dots to establish holistic trend baselines.
2. **Dynamic Trade Execution:** Focus on high-probability entries using 2nd Dot (9) Semaphore within the established trend. Validate with EMA 55 and adapt based on market conditions.
3. **Risk and Reward Symbiosis:** Ensure disciplined risk management with adaptive stop-loss placements and profit-locking mechanisms. Aim for consistent gains and maximize returns by aligning with broader trend movements.
4. **Continuous Improvement:** Commit to ongoing strategy refinement through meticulous documentation, market sensitivity, and psychological resilience.

By fully leveraging the fractal nature of Semaphore signals and integrating dynamic baselines with disciplined risk management, this strategy aims to deliver consistent, high-probability trades. The unified, cohesive approach ensures clarity and efficiency, guiding traders towards capturing a substantial load of pips. Let your trading journey be prosperous and your pip count ever-growing—full steam ahead!

OPTION #2

Enhanced Strategy with EMA and Custom Semaphore Settings - hopefully you can play it out in your mind as you read the strategy.

Semaphore Settings:
- **9 (Small Red/Green Dot):** Short-term price movements.
- **36 (Larger Pink/Blue Dot):** Intermediate-term price movements.
- **144 (Arrow Dot):** Key indicator for trading cycle changes (entry and exit points).
- **576 (Large Square):** Long-term trend, offering a broader market perspective.

Refined Basic Strategy Outline:
- **Entry Point:** Wait for a new Arrow cycle (144) to start.
Enter the market on the appearance of the 2nd Semaphore (9) within the Arrow cycle after the price has crossed the EMA 55.
- **Compounding Trades:** Add to your position each time an additional 2nd Semaphore (9) appears within the current Arrow cycle.
- **Exit Point:** Exit the market at the end of the current Arrow cycle (144) or based on pre-defined exit conditions.

Steps to Execute the Enhanced Strategy
Initial Preparation:
1. **Chart Setup:**
- Set up your chart with all semaphore settings (9, 36, 144, 576) and the EMA 55.
- Configure the chart timeframe based on your trading style (5-minute, 15-minute).

2. **Capital Allocation:**
- Determine your starting capital.
- Use strict risk management principles to allocate capital per trade.

Entering the Market:
1. **Identify the New Arrow Cycle (144):**
- When a new 144 semaphore Arrow dot appears, prepare to enter the market.

2. **Wait for the 2nd Semaphore (9):**
- Wait for the 2nd Semaphore (9) within the new Arrow cycle (144).
- Confirm that the price has crossed the EMA 55 in the direction of your trade:
- Long Trade: Price crosses above EMA 55.
- Short Trade: Price crosses below EMA 55.

Compounding Within the Cycle:
1. **Initial Position:**
- Enter the market with your first position when the 2nd Semaphore (9) appears after crossing the EMA 55.

2. **Additional Entries:**
- Add to your position at each subsequent 2nd Semaphore (9) within the same Arrow cycle (144).
- Ensure each new position respects your risk management rules.

3. **Risk Management:**
- Use stop-loss orders to mitigate adverse movements.
- Adjust stop-loss orders to lock in profits:
- Initial stop-loss: Place at the last Arrow (144).
- For compounded trades: Place stops at the previous 2nd Semaphore (9).

Exiting the Market:
1. **End of Arrow Cycle (144):**
- Exit the market when the current Arrow cycle (144) ends.
- Alternatively, exit based on predefined reversal signals or exit strategy.

2. **Consistent Review:**
- Regularly review market conditions, including larger semaphores (576) to understand the broader trend.
- Consider exiting or tightening your stop-losses if semaphore indicators (36) suggest a potential trend change.

4. Compounding Example:
- **Starting Capital:** $10,000
- **Initial Risk per Trade:** 1% (i.e., $100)
- **First Trade:** Enter on the 2nd Semaphore (9) after crossing the EMA 55 within the Arrow cycle (144). Assume a 1:1 risk-to-reward ratio for simplicity.
- **Compounding Strategy:**
- First Entry: $10,000 * 1% = $100 risk for a potential $100 profit.
- If the trade is successful, new capital is $10,100.
- Second Entry: Enter on the next 2nd Semaphore (9) within the same Arrow cycle (144), and so forth.

Continue to compound as long as the Arrow cycle (144) persists, adding positions at each additional 2nd Semaphore (9) while maintaining risk tolerance and capital limits.

5. Practical Tips:
- **Watch the Larger Picture (576):** Use the 576 setting to guide your overall market perspective and confirm the long-term trend.
- **Intermediate Checks (36):** Use the 36 semaphore for intermediate trend checks. It can provide early warnings or additional confidence in your trade direction.
- **Patience and Discipline:** Adhere to the steps, wait for confirmed signals, and avoid premature entries.
- **Position Sizing:** Use tools to track and adjust your position sizes accurately.
- **Flexibility:** Adapt to market conditions. If larger semaphores (36, 576) indicate a significant trend reversal, be ready to adjust your strategy.

Example Workflow Summary: This is your Daily Mantra
1. **Identify:** New Arrow cycle (144) starts.
2. **Wait:** For the 2nd Semaphore (9) to appear and ensure the price has crossed the EMA 55 line.
3. **Enter:** Initiate a trade and place a stop-loss at the last Arrow (144).
4. **Compound:** Add positions at each subsequent 2nd Semaphore (9) within the same Arrow cycle, placing stops at the previous 2nd Semaphore, maintaining proper risk management.
5. **Exit:** Stop all trades when the Arrow cycle (144) ends based on your exit strategy or if larger semaphore indicators (36, 576) suggest a trend change.

By incorporating these steps and your custom semaphore settings into your trading plan, you can harness the power of compounding more effectively within an intra-day trading framework. Consistency, discipline, and an understanding of both short-term and larger market trends are key to your success.
Happy trading!
Xard777

***NB** There are two 2nd Dots that I use... the (9) 2nd Dot on m5 for Scalping and (36) 2nd Dot on m15 for larger moves. They kind of play into one another as an (144) Arrow on an m5 TF can be a (36) 2nd Dot on an m15 TF. At first people are like WTF! but if you take a step back and look into the goldfish bowl, all possibilities become clear and all roads lead to a boatload of Pip$.* 😁

OPTION #3

Semaphores in Metatrader.

Semaphore indicators are used in MetaTrader 4 (MT4) to help traders identify repetitive patterns of self-similarity across different timeframes, reflecting the fractal-like nature of market behavior. These indicators essentially highlight possible turning points in the market, which can then be used to catch potential reversals or continuations in price movements. Here's a more detailed look into how semaphore indicators work and how they can illustrate the concept of fractal-like structures in trading:

What are Semaphore Indicators?

Semaphore indicators are a type of technical analysis tool used to mark high and low price points (often referred to as ZigZag points) on a chart. They help identify local tops (highs) and bottoms (lows) by plotting points known as semaphores.

Characteristics:
1. **High Points and Low Points**: They plot visual marks at significant swing highs and swing lows.
2. **Fractal Nature**: They can be used to show self-similarity in market movements by marking these points across different timeframes.
3. **Multi-Timeframe Analysis**: The same indicator can be applied to charts of varying timeframes to illustrate both short-term and long-term patterns.

How Semaphore Indicators Illustrate Self-Similarity

When applied to different timeframes, semaphore indicators highlight how similar market patterns or cycles emerge repeatedly, reflecting the market's fractal nature.

Example:

1. **Daily Chart**:
- **Pattern**: On a daily chart, semaphore indicators may mark a major swing high (semaphore 3) and a major swing low (semaphore 3).
- **Self-Similarity**: These swing points represent larger cycles and can be used to identify big trends.

2. **Hourly Chart**:
- **Pattern**: On an hourly chart within the larger daily trend, semaphore indicators might mark multiple smaller swing highs (semaphore 2) and lows (semaphore 2).
- **Self-Similarity**: These smaller swing points form their own cycles within the larger daily trend.

3. **Minute Chart**:
- **Pattern**: On a minute chart, there could be even more granular swing highs (semaphore 1) and lows (semaphore 1).
- **Self-Similarity**: These form even smaller cycles within the hourly cycles.

Practical Application:

1. **Identifying Entry and Exit Points**:
- **Short-Term Trades**: Use semaphore points on shorter timeframes (e.g., minute or hourly charts) to enter and exit trades in alignment with the direction of the larger trend identified on daily or weekly charts.
- **Long-Term Trades**: Use semaphore points on longer timeframes (daily or weekly) to identify major trend reversals.

2. **Multi-Timeframe Strategy**:
- **Top-Down Approach**: Start by identifying the primary trend on a higher timeframe using semaphore indicators.
- **Refinement**: Switch to lower timeframes to look for semaphore points that align with the primary trend direction for optimal entry points.
- **Confirmation**: Semaphore indicators on intermediate timeframes can be used to confirm the direction and strength of the primary trend.

Conclusion

Semaphore indicators in MT4 are powerful tools that illustrate repetitive patterns of self-similarity through market behavior, causing price movements to exhibit fractal-like structures across different timeframes. They enable traders to identify significant price points and understand the nested cycles within the market, enhancing their ability to make informed trading decisions based on multi-timeframe analysis. By recognizing these fractal patterns, traders can better navigate the inherently complex and chaotic nature of financial markets (turn chaos into order).

OPTION #4

Sun Tzu's *The Art of War* is an ancient Chinese military treatise that provides strategic wisdom on warfare, much of which can be applied to trading. By adapting its principles to the concept of fractal trading and multi-timeframe analysis, one can derive useful guidance for navigating the complexities of financial markets. Here's how you can turn *The Art of War* into *The Art of Fractal Trading*.

The Art of Fractal Trading

1. Laying Plans - Planning and Preparation
Art of War: "The general who wins a battle makes many calculations in his temple before the battle is fought."

Fractal Trading: A successful trader prepares by conducting thorough multi-timeframe analysis. They observe and plan trades by identifying key semaphore levels across various timeframes before entering the market.

Application: Before placing a trade, perform a comprehensive analysis on daily, hourly, and minute charts to understand the overall market structure anc identify significant trends and potential reversal points.

2. Waging War - Capital Management
Art of War: "In war, then, let your great object be victory, not lengthy campaigns."

Fractal Trading: In trading, the primary goal is to preserve capital and achieve consistent profits. Avoid overtrading and focus on high-probability setups.

Application: Utilize semaphore indicators to only take trades that align with the trends observed on higher timeframes. Limit the number of trades and risk a small percentage of your capital on each trade.

3. Attack by Stratagem - Strategy and Tactics
Art of War: "The supreme art of war is to subdue the enemy without fighting."

Fractal Trading: The supreme art of trading is to manage risks and achieve profitability with minimal exposure. Use entry and exit points identified through semaphore indicators to strategically enter the market.

Application: Use semaphore indicators to pinpoint optimal entry points that provide the best risk-reward ratio. Exit trades based on semaphore signals on corresponding or lower timeframes to preserve profits.

4. Tactical Dispositions - Positioning
Art of War: "In the midst of chaos, there is also opportunity."

Fractal Trading: In the midst of market volatility, there are always trading opportunities. Position yourself according to the signals provided by semaphore indicators across different timeframes.

Application: Stay adaptive and flexible. When you see semaphore signals indicating potential reversals or continuations, position yourself accordingly. Use smaller timeframes for precise entry points while keeping the larger timeframes in mind for the overall trend.

5. Energy - Efficient Use of Resources
Art of War: "Do not repeat the tactics which have gained you one victory, but let your methods be regulated by the infinite variety of circumstances."

Fractal Trading: Don't rely on a single strategy. Adapt your methods based on the changing market conditions observed through semaphore indicators across different timeframes.

Application: Adapt your trading strategy as market conditions change. When semaphore signals show that patterns are shifting, be ready to modify your positions and strategies.

6. Weak Points and Strong - Finding Opportunities
Art of War: "Appear at points which the enemy must hasten to defend; march swiftly to places where you are not expected."

Fractal Trading: Identify points in the market where there is likely to be a reaction. Enter and exit trades swiftly using semaphore indicators to capture these opportunities.

Application: Use semaphore indicators to spot key support and resistance levels where reactions are likely. Enter trades at these points with clear exit strategies.

7. Maneuvering - Navigating the Market
Art of War: "Move swift as the Wind and closely-formed as the Wood. Attack like the Fire and be still as the Mountain."

Fractal Trading: Be quick to enter trades when the opportunity arises, but also stay composed and disciplined. Use multi-timeframe semaphore analysis to guide your actions.

Application: Act quickly on semaphore signals to capture momentum. However, remain disciplined by sticking to your strategy and risk management rules.

8. Variation in Tactics - Flexibility
Art of War: "In war, the way is to avoid what is strong and to strike at what is weak."

Fractal Trading: Avoid trading in highly uncertain conditions and focus on high-probability semaphore signals. Adapt your tactics based on the market's strength and weaknesses.

Application: Avoid trading against the dominant trend identified in higher timeframes. Seek semaphore signals that align with the market's inherent strengths and weaknesses.

Conclusion

By integrating the timeless strategic insights of *The Art of War* with the fractal nature of market behavior and semaphore indicators, ***The Art of Fractal Trading*** can provide a structured yet flexible approach to navigating financial markets. Just as a skilled general adapts tactics to the battlefield, a proficient trader uses multi-timeframe analysis and semaphore indicators to adapt to the ever-changing market landscape, identifying high-probability opportunities while managing risk effectively.

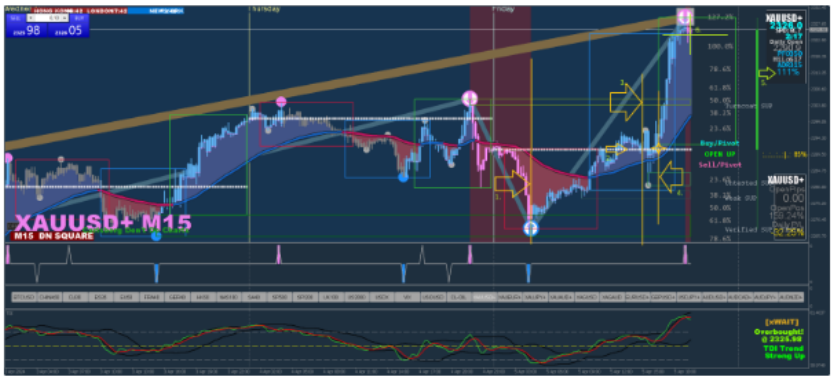
ENTRY & EXIT Rules by Curioso

OPTION #1

> SOLESHOE wrote: 05 Apr 2024, 17:44
>
> I think i had my answer :
> Exit position as soon as oposite color candle appears (followinf opposite arrow), then wait for EMA crossing too take opposite position.

Hello SOLESHOE,

Sorry do not reply at your request earlier, but it´s a very busy day and week and today is for my first day on NFP and it´s so amazing.

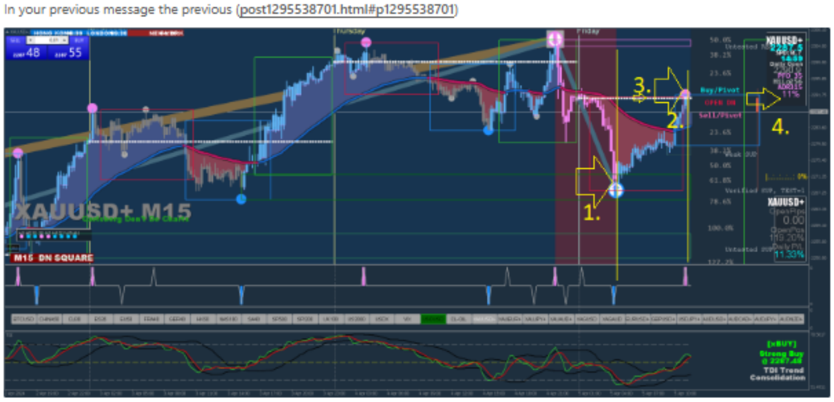


About your answer i catch your image and make my comment is you don´t mind.

Point #1. SemaArrowUp -> Identify the upper trend
Point #2. DailyOpen -> so we wait for candle above and alert upper on that
Point #3. First MiniDot -> then we wait for the 2nd it´s ideal upper on the DailyOpen
Point #4. Second MiniDot (Perfect EntryPoint) , but most important
Point #5. See the ADR, when is upper +15% BUY (or -15% SELL), but wait for the close candle, the background is on the color we want and when all conditions are meet (for example the Spike), and let's do it
Point #6. Stop when the close candle opposite appear

And on this position archive in your pocket +30pips, remember don´t be greedy and stay on the trend when it´s valid.

In your previous message the previous (post1295538701.html#p1295538701)



Point #1. SemaArrowUp -> Identify the upper trend
Point #2. RedDot-> Identify the correction of the trend and we see that with Spike, candle color, and background (for exc)
Point #3. DailyOpen -> so we wait for candle upper and alert upper on that, because you see on white, but if change the color for example to Green to BUY and Red for SELL understand better
Point #4. If we are looking for a trend BUY so we need the ADR +15% and 2nd dot and of course DailyOpen

I hope this help's you and another traders are struggling in this wonderfull strategy.

OPTION #2

Hello everyone,

For today the markets is close but is a great opportunity to observe in real time BTCUSD in M15.

#1. BigSema :: Identify the Major Trend for sell, so we are looking a trend for Sell if applies
#2. 1st MiniDot :: wait, because the trend line continues on blue
#3. 3rd MiniDot :: wait, because the trend line continues on blue
#4. 2nd MiniDot :: wait, because the trend line continues on blue
#5. 4th MiniDot :: wait, because the trend line continues on blue. Maybe is a good entry, but we are looking for a continues trend, so we wait
#6. 1st Dot Colored in opposite direction, if we (i preferred not) entered on that one, we wait in cyan or opposite color
#7. Signal on Moving Average for UP, but we wait
#8. 1st MiniDot after Dot Colored in opposite direction
#9. DailyOpen we the trend is bellow
#10. ADR level, observe with caution the Painel1 the level before your decisions, so >+15% for valid entry for buy or <-15% for valid entry for sell
#11. Background continues on red
#12. Attention to the spike (optional), for this case is only one more confirmation about your trend.

Remember, pay attention on close candle, because when formation of candle maybe you see the color change.

I hope you enjoy, and this way i see charts with XARD (and exists another´s ways to see and enter) and is not necessary switch between TFs in my opinion.

Before asking, this is the latest template post1295538535.html#p1295538535, it continues clean chart, and attached that one there a tips shared too by XARD.

Don´t be greedy, and if you continue with doubts or questions, share with us.

OPTION #3

> Lenovo wrote: 27 May 2024, 13:18
>
> considering that with the xard method, I can't be constant, I continue to follow the post, but I have to evaluate other hypotheses in order to earn something, given that the xard method still doesn't give me the expected results

Hello Lenovo,

This system is complex if you read it diagonally, but it starts with a simpler version, for example 65. It may not even take a month or a year, but it's like a job that takes a lot of patience and dedication, and like everything else in life, it requires discipline, a winner's mindset and not a loser's mindset, but you can do it because is possible a life changer.

Version used to document this process, which for me remains the reference version because of the value management of EMA.
XU-v65 Setup

#1. BIG SEMA , identity your major trend
#2. MINI DOT opposite direction, then we wait
#3. MINI DOT in your direction -> wait
#4. Colored DOT opposite direction, then we wait
#5. Daily Open, in your direction, so we are looking for all the trends valid for the buy
#6. MINI DOT opposite direction, then we wait
#7. MINI DOT in your direction -> wait
#8. Colored DOT same direction, then we wait
#9. MINI DOT opposite direction, then we wait
#10. MINI DOT in your direction -> enter on this point
#11. RSI is cross the line 50 and histogram are green
#12. MINI DOT opposite direction, then we wait
#13. Daily Open, in your direction, so we are looking for all the trends valid for the buy
#14. ADR is upper 15% so is valid for BUY signal
#15. MINI DOT in your direction -> another valid entry
#16. SEMA Arrow in opposite direction so then we wait and continue the trend and watch the move of EMA
#17. Index Entry is a controversy indicator for me, sometimes I preferred to ignore that
#18. MINI DOT opposite direction, then we wait

Re: XARD - Simple Trend Following Trading System # 15798

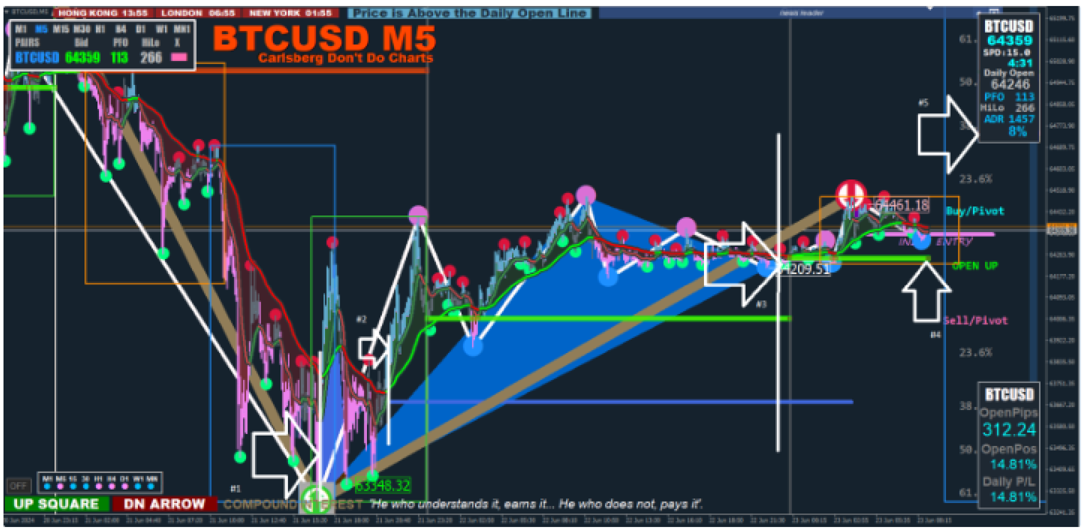
> tmostafa007 wrote: 22 Jun 2024, 10:44
>
> Dear Curioso ,
>
> How can I avoid this issue, or what should I focus on that I might have missed in this trade? that is based on my understanding

> trader2000 wrote: 22 Jun 2024, 16:37
>
> Appreciated, sir. If we examine the 15-minute, 5-minute, and 1-minute timeframes for gold, we will notice the same setup for a sell signal that began on Friday,but it is buy setup now correct?

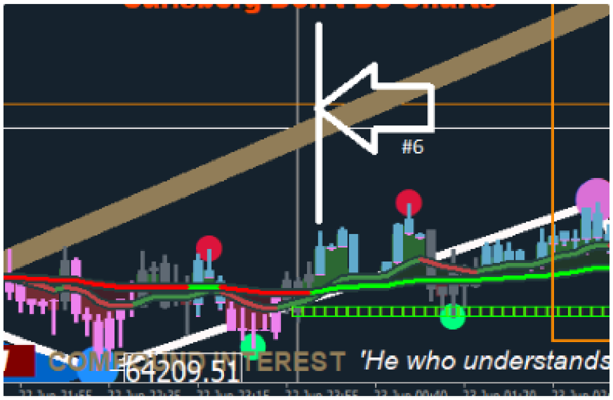
Hello tmostafa007 and trader2000 ,

We are on weekend, but is a great oportunity to learn and understand together this strategy.

First of all @trader2000, don´t forget the PANEL1. is very important to understand where the ADR level are and take your decisions based on that.



#1. BigSEMAUP -> Appear on friday, so lets focus in minidot
#2. 4th minidot -> If you see atention (i do not insert one arrow to you find that one) and the candles are below the DailyOpen and are red, so we ignore that one
#3. BlueDOT -> This one is on the end of your XU v65m-TRIANGLES1 but your candles is above and on green, so is your EntryPoint
#4. DailyOpen -> Keep on your trend and still green, so our entry is valid



#6. PERSONAL NOTE, i hope it helps, zoom in on my entry,

> DaveTrader wrote: 22 Jun 2024, 18:11
>
> With 2 square arrows and 1 arrow, you would instinctively look for a buy set up. Then you see the gaps in the m5 and m15 ma's and realize it's conflicted at the moment and there is some work to be done before a buy trade is considered.
>
> Will it go down and form a double bottom? Fakeout? Breakout? The index entry and daily open (I realize they're expiring , but for discussion sake) are right there. Once you see that m15 ma gap, it's hard to unsee it. This is a time to wait and be nimble in your approach, allowing the market/price action and indicators to give your next move.

@DaveTrader, thank you.

Article in constant evolution

Hello friends,

I share a resume helping me a lot to understand better this strategy, and i share a few tips:

1. Very important is reading the post #1 is a resume for this thread, and of course read with detailed attention this post
   - Source: post1295425924.html#p1295425924
2. Read a pdf attach on the latest strategy, it´s a very cool to understand this strategy
   - Source: post1295533652.html#p129553365
3. Explanation about all the dots
   - Source: post1295421123.html#p1295421123
   - Source: post1295499975.html#p1295499975
4. Next go to understand in better cases the logic behind SEMAs, DOTs, with pictures
   - Source: post1295537082.html#p1295537082
   - Source: post1295536916.html#p1295536916
   - Source: post1295455868.html#p1295455868
5. In this latest version it´s not possibly change the values of EMA, so i preferred using this specific because to learning about that current settings are used
   - Source: post1295520321.html#p1295520321

6. Different versions with revisions by AdeelFx0

- Source: post1295541913.html#p1295541913

7. My rules of this strategy

- Source: post1295538755.html#p1295538755
- Source: post1295540746.html#p1295540746
- Source: post1295542584.html#p1295542584

8. For members are looking for version with source code, a gift from XARD777

- Source: post1295500860.html#p1295500860

9. Learning using Strategy Tester on MetaTrader 4, and take notes according to your trading style

Just remember, like Mr XARD777 said and another members on this thread, this is not a rocket science, just follow the simple rules, but in the beginning is not easy understand the logic, but it persistence, dedication, patient, if not working at first time, or in +1 year, but if you want, you can do it if your propose and dedication if this, your life changes in a short space of time when you achieve perfection and consistency at the end of the day/week or month, believe it or not.

There's a lot of great content in this thread and it helps both novice and advanced traders, and I'd like to say a big thank you to all the members who contribute daily, with their knowledge, detailing the purposes, and who help us make it happen every day. For you, who are reading this post now, I hope it helps with your winning mindset, but if you have any doubts, you're in the right place to help each other.

XARD - Double TDI Trend Following System

This is my trading system.
Since last June
I found that TDI is very suitable for filtering the sideways market and can quickly spot the trend after
I'm obsessed with it.

Thanks to Mr. Tools, kvak, xard777, for developing indicators and trading systems all the time.

Enter
RSX TDI market baseline breaks through 55line/45line
RSX TDI Signal Line breaks Bollinger Bands and 68Line is overbought or 32Line is oversold
RSIOMA is located at 70line/30line
(Slow TDI market baseline breaks through 55-45LINE, implying that a long-term trend may be coming)
exit
RSIOMA 50LINE color change
wait
RSX TDI market baseline is between 55-45LINE
Slow TDI market baseline is between 55-45LINE
RSIOMA Do not trade between 70-30LINE
