Forex Innovator

Introduction

Before jumping straight to our members' forum to practice trading on this strategy, please read every word of this manual and review all the chart samples provided. This strategy is based on very powerful support/resistance levels, which you can witness the power of as soon as you apply them on your chart. Although we recommend using these levels with our out-lined trading rules, you may still combine these levels with your own trading strategies to pick up the best entry levels.

Due to GMT offset from one broker to another and DNS settings. The close on the 4 hours daily candle will differ from one broker to another. In an attempt to unify our members' charts and to take trades based on where we have tested and modified the strategy for over 16 months, we ask you to please download the AI Trade MetaTrader platform from this link:

<http://www.alforex.com/forex-trading-platform.aspx>

We DO NOT recommend opening a real account with this broker. You can use their platform to analyze the market and then proceed to execute trades on your own broker no matter what your broker platform is. **That is exactly what we do.**

While the system is still profitable on all platforms, if you insist on using your own broker platform to analyze the market based on our strategy, then please do NOT post your charts on the members forum and please don't share your entry and exit set-ups based on our strategy with other members if you apply the system on a different platform to avoid confusion.

In other words, only AI-Trade charts and AI-Trade trading calls are allowed on our members' forum. This is to maintain consistency, thank you.

The following are details regarding the indicator software included. For installation instructions please refer to the installation videos.

Please note that you don't need to watch the chart for hours. Just simply check the 4 hours candle timer on the chart, which displays a countdown for when the candle closes (this tool is provided with the indicator package software) and see when the candle will close. If you see it is about to form a line-up of all entry conditions (explained later), then you can place a trade. You'll find the candle timer on the right side of the last candle displayed on your chart, which is the open candle. Here is a screenshot just to make sure that you clearly understand what we are talking about:

The "InnovatorLevelsIndicator" is a classical indicator that does NOT repaint (If you do not know what repainting means, please refer to the website, but it is not important to understand) the powerful support/resistance levels it draws which can be combined with various classical analysis of your own. Yet again, if you don't have your own profitable trading system we advise you to stick with our own filters and entry rules.

There is also an "InnovatorTrendIndicator" included that also features an automatic trend channel drawing to help you evaluate your trading risk. This channel trend drawing feature will draw the channel based on at least two tops or two bottoms picks from your chart. The more tops or bottoms the channel line is based on, the more powerful that trend channel will be.

If you do not understand any of this please be patient and read on, more will be explained, including images.

The way entries are determined from these powerful levels is through filtering these opportunities to only take the best trades with the high probability of success.

Warning: this is a reversal based strategy, please don't attempt trading based on breaking out above or below the strong levels. Always wait for opportunities to come to you and avoid trading on big and powerful news events that sometimes just don't get counted into the chart technical ahead of release, namely the NFP and interest rate release.

Always put more weight on the higher time frames analysis and try to combine those higher time frames outlook with your smaller time frame levels.

To clarify the difference between reversal and breakout trades, please see the figure below:

So let's start by outlining the system trading rules, then move on with charts samples.

Trading rules:

Candlestick Closings: Entering a trade is triggered at the close of a candle, when it TOUCHES the resistance or support level as long as the close is no more than 20 pips away from that level and no less than 3 pips. If the price **goes up** and closes 14 pips **below a resistance level** (or anywhere in between 3 to 20 pips), then entry will be a sell from the open of the next candle. If the price goes down towards a support level and closes 4 pips above the support level (or anywhere in between 3 to 20 pips), then entry will be a buy from the open of the next candle.

By Dean Sander

<http://www.ForexInnovator.com>

Page 5

To clarify, support and resistance levels are the horizontal lines on your chart. The horizontal line above the price is the resistance and the horizontal line below the price is the support.

Please keep in mind that it is preferable to have the candle actually touch the resistance/support level before it closes.

Important note: Sometimes the next candle will open with a big price gap compared with the previous closing candle. Do not take the trade when that happens.

Stochastic Indicator: Once the conditions on the Candlestick closing are met, you MUST look at the stochastic indicator with 5,3,3 settings (especially when you first start using the system, this is all setup automatically when you install the system). The Stochastic needs to be above the 80 line territory or has touched it when selling and below the 20 line territory or has touched it when buying.

Look for either the stochastic red line or blue line to touch either the 80 or 20 line value. Touching the 80 or 20 lines can't be credited for until the current candle actually close. You will find on many occasions that the 80 or 20 lines get touched, but then retreats back once the current candle reverses.

The Stochastic crosses down when the blue line goes below the red line, and crosses up when the red line goes above the blue line.

Crossing down or up is not necessary, but can decrease the trade risk.

Time Frames: The time frame for this strategy is the **4 hours frame or H4**. However, always look at the Daily chart. If you see that the current daily candle is less than 100 pips below a resistance level on the daily chart, then your trade risk is higher.

The same goes when selling on the 4 hours chart. If you see the current daily candle to be less than 100 pips above a support level on the daily chart, then your trade is riskier.

Basically, if you see that the daily candle has considerably tight space to reach the next support/resistance level against the direction of your 4 hours trade pick, then your risk is higher.

If you get buy or sell conditions on the 4 hour chart and the daily chart shows a breakout, a close above a resistance level or below a support level, then disregard whatever the daily chart says and stick with your 4 hours analysis.

InnovatorLevel Indicator: Do not enter a buy position if the next resistance level is less than 50 pips away, and do not sell if the next support level is less than 50 pips away from the resistance level where conditions were met. You **MUST** disregard the level if you see that the price has not been respecting it recently and closes below/above that level and then closes back above/below it. Disrespected levels are kept on your chart so that you consider them if you are already in a buy/sell trade, but never actually enter from these levels.

If you see a line-up of entry conditions, but the level has not been respected before, **then entry is NOT valid**. Just keep in mind that we don't care about how the price has been respecting that level in the past 30 days or so. All we need to look at is the previous one to two days (or whenever the last test was). If you actually see the price not respecting the level in the past tests and it just started respecting the level in the last test, then that level is good to go, and we can enter as soon as the trade conditions line up.

Again, obviously we don't need to look at how the price has respected the support/resistance level if that level is clean and has not been touched recently.

How do we know that the price not respecting that level?

If you see candles closing above and below that level. This is a big indication that the level is actually weak. Keep in mind that we are referring to actually closing below and above the level, if the candle goes below a support level for example and still manage to close above it, then we still consider that level as respected.

This is a very important point; please see the following chart samples for clarification:

Hopefully by now you understand how to identify a level that has not been respected by the price and avoid dealing with that level, as well as identify levels which have been well respected by the price and trade from them once conditions have lined up.

Please check all the below price chart samples to make sure that you understand correctly:

FOREX INNOVATOR

IMPORTANT NOTE: The price **MUST** test a level through a trading wave in order to count that as a test, going sideways and testing on a single candle does not count, please see the following two charts to see the false tests:

In this chart, the **red** level has been respected with one candle only on a sideways market, we don't enter from that level because the price has not respected it (Please note: the price test must be in an up or down wave, not in a single candle on a side way movement).

In this chart, the price traded sideways and tested the support zone with a single candle; the price has never respected that zone in the tests we circled around in blue. The single candle test we are trying to point out here has been circled around in red:

The price however has just started respecting that support zone in the last test which we have circled around in black:

Please check out what we mean by wave movement in the following chart, the price has respected the green level on three correct tests (Wave tests):

FOREX INNOVATOR

THE MOST POWERFUL AND CONSISTENT QUICK PROFIT FOREX TRADING STRATEGY YOU WILL EVER USE

704 1 1682 1 1754

ADD JUST \$495 PER MONTH TO YOUR EXISTING ACCOUNT

On your 4 hours chart, you will see 4 hours levels + weekly levels + monthly levels. Entry is from the 4 hours, daily, weekly and monthly levels. The 4 hours are the most powerful levels if the four hours condition requirements are met.

4 hours levels can only be used for entry, **if we find two or more levels in a tight zone (Forming a support/resistance zone)**. The more 4 hours levels we find in a narrow area on the chart the better and stronger that entry zone. **We can also enter from a four hours level if we see that price has been respecting it.**

Please note: the trend **channel** (grey color) could be counted and added to a green level to meet its minimum requirements.

The more levels we find in a tight zone be it monthly, weekly, daily and 4 hours, the better and the less trade risk we will have if trade conditions line up from that zone.

If you see more than one green level in a tight zone, then that green resistance/support zone would be considered stronger than a monthly or a weekly resistance/support. However, if you see a 4 hours or daily or weekly or monthly being respected by the price, then that level would be one of the strongest ones on your chart.

We have unified the colors of these levels to the following:

4 Hours: Green color

Daily: Blue color

Weekly: Red color

Monthly: Pink

The Green lines do not count for entry unless we see two or more in the same narrow zone, or a clear previous price respect and bounce off from that level, or crossing with a gray trend line that has at least two tops in case of selling and two bottoms incase of buying.

After testing this strategy for well over 16 months (on a daily basis) we found that the 4 hours chart respects the 4 hours levels (green levels) the most. And the daily chart respects the daily levels the most. As a technical trader, I found this observation pretty surprising and took me months to confirm it. In classical technical analysis we always look for higher time frames levels to deal with on lower time frame charts, but with this indicator and the way it spots strong levels, things are just different.

More info on that in the Video instructions.

On the Daily charts, the case is different, the chart won't show the 4 hours lines.

We have unified the colors of these lines; basically, it's the same colors as in the 4 hours charts with the addition of the monthly lines:

Please check out this chart sample on the 4 hours time frame, the price went up to the green level and closed the 4 hours candle below it. The stochastic has touched the 80 line and the trend is down. Even though we have good conditions lined up to sell this currency pair, we just can't enter for two reasons: first, the green line has not met the trade requirements, second, the green line has not been tested as a resistance level except for once previously, **and it has not been through a wave.**

USDJPY,H4 85.7305.
The Green level is not backed-up with with any other level or a gray trend channel. But it is still valid for entry since the price action has actually respected it on two recent test.

Trading Time: You can trade this system at any time, Monday through Friday, avoid late Friday session, which is 4 hours after the US session opens on Friday towards the close of the week. Also, avoid the first Asian and European sessions of the week especially if you see strong market gaps.

If the gap is too strong on a currency pair (100s of pips), then avoid trading on that pair for the rest of the week.

What is a market gap?

It's the price difference between the price of the close on Friday, and the price open on Monday.

OR

A price gap can also be referred to as the price difference between the current candle close and the next candle open.

Stoploss: Place your stoploss 10 pips above a resistance level which comes AFTER the resistance level (or resistance zone) where you sold from. And vise-versa in case of buying where stoploss goes 10 pips below a support level. So the total stoploss should depend on where the next resistance level is located. Please check the chart samples on how we pick the stoploss.

Keep in mind that we do NOT enter the trade if we see that the stoploss set-up would be a lot more than our target profit set-up. (Risk/Reward Ratio that is)

Target: First target is 20 pips, Second target is 50 pips. And you can look to close above 50 pips if you see fit. The strategy is meant to be entered with a full position at once.

You may extend your target later once you master the strategy, but ALWAYS let your target be at least 60 pips away from the next level on daily chart trade pick and 20 to 30 pips on a 4 hours chart trade pick in case if you want to extend your target.

(when we say let your target be at least 60 pips away from the next level we mean 60 pips below the nearest resistance on the daily chart when buying and 60 pips above the nearest support on the daily chart when selling but again that is only incase if you would like to increase your target to above 50 pips).

Please note: If you see your second target to be beyond a strong level, then you'll need to lower your second target down and place it before a strong level. While the Risk/Reward ratio is dynamic, keep in mind that your stoploss is being protected by a strong level and is actually hard to get hit when placed properly.

DO NOT enter if you see that the total stoploss will be above 160 pips on the 4 hours chart trade pick to preserve a good average Risk/Reward ratio on your trading portfolio. And maintain a nice equity curve even if you get a stoploss hit every once in a while. Keep in mind that this strategy depends on the 4 hours time frame trade picks, not a 5 minutes or a 1 hour, which makes our entries VERY solid!

Also, you must stick with the first two targets plan and never hit and run with the first 20 pips target on a full position. You must close half at 20 pips and the second half at 50 pips to average a nice Risk/Reward ratio.

After understanding this system, you will find that 50 pips is easy to achieve, and you won't need to lock up some of your profits at +20 pips.

Exponential Moving average 200: This indicator as well as the stochastic is freely available on your MT4 platform. If this indicator happens to be located within the same support or resistance zone, then that would add more strength to that zone. This indicator loads up along with the other indicators on your chart.

Money Management

InnovatorTrendIndicator: (Color is gray by default) This has been added to help you determine the current trend of a currency pair. We do not count on it unless it is based on AT LEAST two bottoms when buying, or two tops when selling.

We recommend that you zoom out on the chart to determine whether the currency is trending up or down or just going sideways.

See beginner's video on how to "visually" determine whether the trend is up or down.

The only scenario when this indicator does get counted as an entry factor is when it builds up on at least two price tops or two price bottoms and is crossed with any time frame support/resistance level.

In other words, if you see a gray trend backing up a red or green line for example, you MUST verify that the gray trend channel has AT LEAST two bottoms when buying and two tops when selling, otherwise, the gray trend line won't help the green line to meet its entry requirements.

When you first start using this system only stick with trade opportunities that go with the 4 hours timeframe trend. Do not go against the trend if you are a beginner.

If you find a trade entry opportunity with the direction of the trend on the 4 hours time frame, and after checking the daily chart you find that it has the same trend direction as the 4 hours. Then that would lower down your trade risk and increase your trade winning probability.

IMPORTANT NOTE: If you go against the trend on the four hours chart, (besides closing early on 20 pips target) try to lower down your stoploss, but still get it beyond a strong level.

This indicator has been added for the purpose of showing the trend direction (But again, do not count on it). **A trend direction must be visually identified.**

The trend channel has a line in the middle which we ask you to completely disregard. That middle line can only be used by trend channel traders to close trades on profits once the price touches that middle line. In the case of our strategy we're teaching here, it will not be necessary.

Trailing Stoploss: If the price hits your first target where half of your position is closed, then move the stoploss for the second half 20 pips below your entry level. So if the price retraces back 40 pips and hits your stoploss, you will actually end up at breakeven.

Time Frame: If you have good sell conditions lined up on the 4 hours chart, and you check the current daily chart and find out that the daily candle is less than 70 to 50 pips away from the next resistance level, then your sell trade on the 4 hours has a less risk.

The vise-versa when buying on the 4 hours, if you see the current daily candle to be less than 70 to 50 pips above a support level on the daily chart, then your buy trade on the 4 hours has less risk.

Adding to a losing position: In case, if all conditions line up **with the direction of the trend**, and the price goes against you, add to your position to double your normal position size. And use the same exact stoploss level for that second position as your first, while the target is breakeven or small profits. NEVER EVER add to a losing position if your entry is against the trend. Never add to a losing position more than once in the same trade!

Do not add into a losing position until you have practiced trading the strategy for a long enough period of time for you to master and understand it.

Adding to a losing position has to be done as close as possible from the level where your stoploss is hidden behind.

Please see the figure on the next page for further clarification.

In the case of selling:

In case of buying:

The following illustration is for how and when we add to a losing position. In this case **the trend is up!**

Our favorite reversal candles:

Just keep an eye on our favorite reversal candlestick formation which you will run into while using our system. We find that reversals occur after lining up all conditions coupled with the **CLOSE** of either one of these two candles to be immediate and powerful. We also favor them because they usually give us the chance to enter after they close, at the open of the next candle.

Bearish and Bullish Reversal Candles:

By Dean Sander

<http://www.ForexInnovator.com>

Page 31

The white candle formation could show up after an incline in price and touching one of our strong resistance levels

The black candle formation could show up after a decline in price and touching one of our strong support levels

Recommended Pairs

We have found these pairs to respect our strong levels and have the least stoploss hits in comparison to other pairs.

The first and best line of recommended pairs are

eurusd - audusd - usdcad - usdjpy - usdchf - nzdusd - gbpusd - audcad - cadjpy

The second line of recommended pairs are:

gbpjpy - eurjpy - gbpaud - eurgbp - audchf - gbpcad

The total is 15 currency pairs to work with.

We recommend starting with the first best line, then after fully understanding the strategy and having enough practice, you may move on to the second line of recommended pairs .

Finally, try to avoid trading during strong news events, namely the NFP and the interest rate news. Forex innovator does not get much affected by the news and is news friendly, but risk certainly does go up during these two strong events.

Here is a link to a good website you need to check once every Monday to make sure these two news events are not listed.

<http://www.forexfactory.com/>

If they are listed, however, just simply avoid trading few hours before and few hours after their release. I personally avoid them 50% of the time.

By Dean Sander

<http://www.ForexInnovator.com>

Page 33

Hit the "this week" tab to view the entire news event table for the week as you see on the following screenshot:

Other news events do not bother our system, the market positions ahead of the news release, and all future reaction is expressed through the current and past price action.

Trading chart samples

After all these do's and don't rules, and all the instructions that could make things seem complicated. The fact remains that this system is actually easy to use.

Cad/Jpy Sell Opportunity... 4 hours

704 1 1682 1 1754

ADD JUST \$495 PER MONTH TO YOUR BANK ACCOUNT

After hitting our target profits from the first CadJpy chart trade above, the market has formed another trade opportunity, but this time it's a buy opportunity as shown on the above chart.

Notice how the Stochastic indicator has crossed up, which has decreased the trade risk.

The support level is the 88.28<>88.45 zone, look at how the price has respected that 88.28 level and kept closing above it or "slightly" below it.

This buy opportunity is with the direction of the trend. So we may increase our normal lot size since the risk in this trade is lower than the other trades.

The next resistance level is 89.70 which means a lot more than 50 pips away from the support level we have bought from.

Stoploss is 10 pips below 87.66 level

=====

EurUsd Sell Opportunity... On the Daily

The price has bounced back from the top of the resistance zone.

The trade is with the direction of the trend. And the next support line is more than 50 pips away from the blue resistance where we are entering from.

The Stochastic Indicator has crossed down after hanging above the 80 line, which decreased the trade risk.

By Dean Sander

<http://www.ForexInnovator.com>

Page 38

Stoploss is 10 pips above the blue level which is 1.2450 (which is right above the previous black candle)
So total stoploss is our maximum 160 pips set-up.

Here is how things turned out. We have easily reached our second 50 pips target

=====

In the following chart sample we will be showing how we double check on the daily chart to make sure that the close of the daily candle does not contradict the 4 hours trade opportunity.

- ✓ 30 DAY MONEY BACK GUARANTEE

GbpCad Sell Opportunity... 4 hours

When this last 4 hours candle actually close (20-30 pips) below the resistance level, the stochastic would have touched the 80 line signaling a sell.

The next nearest support level is 1.5148, which is more than 50 pips away from the resistance level we're entering from which is at 1.5240.

Now let's check the Daily chart to see if it cancels this sell opportunity:

ADD JUST \$495 PER MONTH TO YOUR FOREX ACCOUNT

EurGbp Sell Opportunity... 4 hours

All conditions are lining up on this chart and we are just waiting for the 4 hours candle to close 3 to 20 pips below the resistance.

The next support level is more than 50 pips away

The trade is in the direction of the trend

The Stochastic indicator has touched the 80 line

Stoploss should go 10 pips above 0.8336, which is the second horizontal green line above the blue line where we are looking to sell from.

UsdCad Sell Opportunity... 4 hours

Again, waiting on the 4 hours candle to close below the resistance level. The Stochastic is above the 80 line and is in an extreme over bought status.

Note how the trend line has helped the green line to meet the minimum entry requirements.

If the 4 hours close as per our rules, then this trade will be with the direction of the trend, and the next support line will be over 50 pips away.

=====

UsdJpy Sell Opportunity... 4 hours

This is an after image, but you can see the sell opportunity was aligned.

Sell was from the 89 green level.

The stochastic was in the overbought territory.

Stoploss in this case should be kept tight and right above those two green lines we entered from.

Target has been hit.

=====

By Dean Sander

<http://www.ForexInnovator.com>

Page 47

UsdCad Buy Opportunity... 4 hours

The Stochastic Indicator has touched the 80 line.

The entry is from the close of this current candle, since the previous one has not touched the support zone.

The support zone consists of two monthly and one 4 hours support levels (powerful zone)

The trade is against the 4 hours trend and thus stoploss is kept tight 10 pips below the next blue support level 1.0378, which is the blue line right below the entry levels zone.

ADD JUST \$495 PER MONTH TO YOUR CREDIT CARD

We have two 4 hours green lines in a narrow zone, and has been respected on two tests. This means the green line has met its requirement to buy from and is actually very powerful.

The trend is down, so since we are looking at a counter trend trade, we will not increase our lot size.

=====

UsdCad Buy Opportunity... 4 hours... WE DON'T ENTER!

FOREX INNOVATOR

The Stochastic went below the 20 line and has just crossed up.

Why did we not look to enter from the candle before that one? In other words, why did we not enter 8 hours ago?

By Dean Sander

<http://www.ForexInnovator.com>

Page 52

FOREX INNOVATOR

THE MOST POWERFUL AND CONSISTENT QUICK PROFIT FOREX TRADING STRATEGY YOU WILL EVER USE

704 1 1682 1 1754

ADD JUST \$495 PER MONTH TO YOUR CREDIT CARD

It is because during that day, almost every 4 hours candle has registered a new low, so we just can't enter as soon as we see a candle open above a strong support zone.

Note that the zone constitutes of two red lines, one blue line, and one green line, which makes it a solid zone to count on when buying.

Stoploss must be kept tight since the trade is against the trend, so there is a green line right below 1.0195... Stoploss goes 10 pips below it.

So all is perfect, isn't it? Have we forgotten something?

Yes, the next resistance level is only 30 pips away from the support zone where we are looking to enter from and thus, the entry is NOT valid.

=====

AudUsd Buy Opportunity... 4 hours

This is one of those good and clear opportunities.

The stochastic is below the 20 level, and has crossed up.

The black candle has closed (3 to 20 pips) above the green level, so entry is right at the open of this current candle

The green line has met the minimum requirement by crossing with the trend line at the time when the candle has touched it.

The trade is with the trend.

The next resistance line is more than 50 pips away.

Seems all is perfect, should we increase the lot size as part of our money management when dealing with trade opportunities that offer lower risk?

By Dean Sander

704 1 1682 1 1754

ADD JUST \$495 PER MONTH TO YOUR BANK ACCOUNT

That is about 90 pips difference, so there is still space for the daily candle to move down which increases the risk on our buy position on the 4 hours chart.

Also note that the stochastic indicator on the daily chart is at the 80 line.

In conclusion, although the 4 hours chart shows one of those strong trade opportunities, the daily chart made us realize that the risk involved in this trade opportunity on the 4 hours chart is not that low. Thus, we don't increase our normal lot size position, which we normally would when we see good conditions line up on the 4 hours chart.

704 1 1682 1 1754

ADD JUST \$495 PER MONTH TO YOUR BANK ACCOUNT

The Stochastic has touched the 20 line.

A monthly support at 1.5522 coincides with a trend-line. And is backed up with a 200 Exponential moving average (Green line).

Stoploss is 10 pips below the red 1.5370 level. Our maximum Stoploss set-up is 160 pips, but could be increased by 20 pips in case of a daily entry. Entry is NOW from current candle.

So just make things clear Entry is at 1.5540, stoploss is at 1.5360, 1st target: 1.5560, 2nd target is at 1.5590.

=====

By Dean Sander

<http://www.ForexInnovator.com>

Page 63

EurJpy Sell Opportunity... 4 hours

The Stochastic has almost touched the 80 line.

The 4 hours candle has closed below the red level which also coincides with the gray trend line channel.

Entry is now from this current candle since the previous candle has tested the red line and already closed.

The trade is with the trend.

By Dean Sander

<http://www.ForexInnovator.com>

Page 64

Conclusion:

As you can see our strategy is **STRONGLY** based on the actual price action. This is the true power of the Forex Innovator strategy and what help you stay consistent when using it no matter what the market conditions are. However, please keep in mind that you must practice in order to understand the strategy. It takes experienced traders a couple of days of practice while it may take beginners well over one month to be able to trade on this strategy.

We highly encourage you to participate in the forum and hang-out at the chat room where the strategy designer is available so you can ask questions and trade with him.

You don't need to wait until you understand the strategy to start taking trades and making money. You can tune up with the forum members and check out the trade call charts posted there by Master members and the strategy designer and hang out at the chat room to trade with us.

We look forward to seeing you there!
